RAILINGS AND GATES OF CHARACTER AND BEAUTY

Iron Railings and Entrance Gates of appropriate design and perfect proportion would add much to the dignity and attractiveness of many country places. In other locations, for the protection of lawns and gardens, an

ANCHOR POST FENCE

with galvanized steel posts and woven wire panels, makes an admirable and long lasting enclosure.

We have catalogues illustrating Entrance Gates and Iron Railings, Lawn Fences, Tennis Court, Poultry and Kennel Yard Enclosures, Aviaries, Arbors, Trellises, etc., and will gladly mail you the one you need.

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation. Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases.

Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

The Standard Documents of the American Institute of Architects

The New Contract Documents of the American Institute of Architects are now on sale and replace the old Uniform Contract, which is to be discontinued

PRICES FOR SINGLE COPIES

Agreement and General Conditions in cover	\$.10
Bond of Suretyship	02
Form of Subcontract	02
Letter of Acceptance of Subcontractor's Proposal	01
Complete set in cover	15

Trial set delivered upon receipt of nine 2-cent stamps.

These Documents have received the full approval of the Institute, through its Convention, Board of Directors and Officers. They are the outcome of nine years of continuous work by a Standing Committee on Contracts and Specifications. This Committee, comprising some of the ablest American architects, was assisted by the Institute's forty Chapters; advised by eminent legal specialists in contract law and aided by representatives of the Building Trade Associations of the United States. The forms have been officially approved by the National Association of Builders' Exchanges, the National Association of Master Plumbers, and the National Association of Steam and Hot Water Fitters.

John Baizley Iron Works (C), 5142 Delaware avenue. Cost, \$500. Steel tank support, 609 Chestnut street.

W. W. SUPPLEE DIES AT AGE OF 83 YEARS.

William W. Supplee, former head of the Supplee Hardware Company and an ex-president of the Trades League, now the Chamber of Commerce, died Friday night at his home, 4102 Walnut street. He was 83 years old and had been ill for several years, having given up all his activities when his health failed.

Mr. Supplee was a member of the Union League and of the City Club since its organization. He was born in Montgomery County, his early education being received in a school-house which his grandfather built, a few miles from Norristown. He continued his studies in the Tremont Seminary. In 1853 he came to Philadelphia, but later went to La Crosse, Wis., with a schoolmate. They operated several stores, soon branching into all parts of the State. In 1867, with his partner, the late W. J. Lloyd, Mr. Supplee returned to this city. Buying out an established firm, they began operations under the name of Lloyd, Supplee & Walton, Mr. Walton being associated with the firm whose interests they had purchased.

In 1889 Mr. Supplee bought out Mr. Lloyd's interests and the firm became the Supplee Hardware Company, Mr. Supplee being made president, an office he held until three years ago, when he sold his interests.

Mr. Supplee was one of the organizers of the National Hardware Association, being its first president, and for years was a vice-president of the Corn Exchange National Bank. He was also made the first president of the Hardware Merchants and Manufacturers' Association of this city, which he was instrumental in organizing; a director of the Philadelphia Bourse and of the Philadelphia Museum.

OFFICERS FOR HEATING ENGINEERS NOMINATED.

Officers for the American Society of Heating and Ventilating Engineers for the coming year have been nominated by the regular committee. A ballot will be sent to the members in due course and the result made known at the annual meeting, to be held in New York this month. The candidates for office as selected by the committee are as follows: President, Harry M. Hart, Chicago, Ill.; first vice-president, Frank T. Chapman, New York City; second vice-president, Arthur K. Ohmes, New York City; treasurer, Homer Addams, New York City; council, D. D. Kimball, New York City; Henry C. Meyer, Jr., New York City; Dr. E. Vernon Hill, Chicago, Ill.; Frank J. Cooper, Boston, Mass.; Walter S. Timmis, New York City; Charles R. Bishop, North Tonawanda, N. Y.; Fred R. Still, Detroit, Mich., and M. W. Franklin, East Orange, N. J.

MASTER BUILDERS ON EDGE FOR MEMBERSHIP CRUSADE

"Bigger and More Prosperous Philadelphia" to Be Slogan of Exchange in Canvass for Widened Rolls

"A bigger and more prosperous Philadelphia" will be the slogan of the members of the Master Builders' Exchange, who will open a campaign this week for the purpose of increasing the membership from 200 to over 1,000.

Plans for the whirlwind canvass of the city were completed at the headquarters of the Exchange, on Seventh street, above Chestnut. January 10, 11 and 12 were decided on, and, in addition to other prizes to be offered, Congressman Moore pledged \$25 for the team that made the best showing in garnering new members.

The meeting which resulted in preparations for the launching of the campaign also included the annual luncheon, smoker and vaudeville entertainment which the builders hold to welcome in the New Year. Thomas F. Armstrong presided at the luncheon and the principal addresses were made by Director of Public Safety-elect William H. Wilson, Congressman Moore and W. Nelson Mayhew, who was chosen chairman of the committee which will manage the membership campaign.

In the course of his address Chairman Mayhew said:

"Preparedness is a national slogan, so be it with the exchange. Preparedness for what? For labor troubles, for the evils and abuses in the building trades that will arise if we do not have a central body where builders may meet and extend their usefulness, and for the purpose of getting better acquainted with each other.

"In this city at least 2,000 men engaged in the building business are eligible to membership in the exchange. The exchange needs

the moral support of these 2,000 men, and these men need the protection and assistance that the exchange can give them.

"Philadelphia needs more and more and better and better buildings, and to obtain this end a greater exchange is an absolute necessity."

More education along practical lines and less for professional callings was advocated by Congressman Moore. He said:

"Much of our trouble to-day is due to the lack of practical education on the part of the youth of the country and the desire of many of our people to avoid hard work and strike the rosy side of the road. If, in our public schools and in those institutions that receive government aid, we had less education for professionals and more for practical men, it would be a good thing. While we are talking preparedness for war, there ought to be some discussion of our preparedness for that peace and domestic tranquility which is guaranteed by the Constitution of the United States. We need more builders and less lawmakers at the present time, more substantial and enduring work and less in the way of agitation and discontent, for as soon as the European war is over we will be at our wit's end to hold our own.

"If the European war has taught us anything," he said, "it has taught us the value of discipline in the education of the youth. In the United States we accord public education to our young men and young women without expecting any particular service in return, except as to such out and out military establishments as are conducted by the government."

FIREPROOF FURNITURE URGED.

Department Wants Law to Compel Its Use in Offices.

Fire Department men, both the officers and the actual fire fighters, are a unit in approval of fireproof furniture for offices. They say that an office becomes a fire menace when it is furnished with wooden desks, card cases and the like packed closely together, as often is the case, plus row upon row of files filled with paper, letters and baskets filled with waste paper, not to mention the rugs and carpets.

Fireproof walls and ceilings prove of no avail, it is argued, when a fire starts in such an office, for the flames quickly leap through

windows into other offices equally filled with similarly inflammable furnishings and so spread from floor to floor.

Fire Commissioner Adamson, of this city, calls buildings filled with such offices worse than furniture warehouses so far as fires are concerned, and has declared that he is in favor of a law requiring all office furniture on floors at a certain height from the ground to be made of metal or non-burnable materials.

Fire prevention is not the only advantage of fireproof office furniture. It is superior to wooden furniture also in durability, possibility of removal and erection without damage to the goods, absence of warping, sticking and cracking and protection against mice and vermin, while damage by water is reduced to a minimum.

BIG CEMENT COMPANY EXTENDS TO VIRGINIA.

Lehigh Portland Concern Plans to Reach Out for Southern Business.

ALLENTOWN, Pa., January 1.—Announcement was made New Year's morning that the Lehigh Portland Cement Company had this week acquired ownership of the Virginia Portland Cement Company property, located at Fordwick, Va., on the Chesapeake and Ohio Railroad.

The Lehigh Portland Cement Company, which is headed by Colonel Harry C. Trexler, last year produced 12,000,000 barrels of cement at 12 mills located in Eastern and Western Pennsylvania, Indiana, Iowa and the State of Washington.

The Virginia plant, which is a 1,000,000-barrel mill, will be used to supply the trade in Virginia, West Virginia and the Carolinas, to which the Lehigh Company has not, up to this time, had access because of high freight rates from this region.

The new purchase involved nearly \$1,000,000.

REAL GOLD UNMINED.

"I am here as the self-appointed representative of 900 trade and technical publications printed in the United States and circulated wherever the English language is spoken. How important they are in their relation to advertising may be understood when I tell you that they carry, in the aggregate, advertising to the amount of at least \$25,000,000 a year—one-eighth of all the advertising money that is spent for all forms of publicity in the country—and that these advertisers "stick" year after year because it pays them to stick.

I have bought, sold and written all kinds of advertising—pasted and printed, indoor and outdoor, consumer and dealer, technical and commercial—and I have reached the conclusion that there is more real gold as yet unmined in the trade press field than in any other field of advertising endeavor."—Extract from address by R. R. Shuman, before the annual convention of the Associated Advertising Clubs at Omaha.

SOME MORE ADVERTISING "DONT'S."

Don't try to do a million dollar business on a two thousand dollar basis.

Don't try to advertise a quarter page proposition in a three-inch space.

Don't belittle a big business reputation by running a piking little "ad" among piker competitors.

Don't overlook the fact that as a man is judged by his stationery, so a firm is judged by its advertising.

Editorial Comment

An address that has a direct bearing on the plans now under way to provide additional opportunities for the education of the heating and ventilating engineer was delivered recently before the Cleveland Engineering Society by Professor John R. Allen. Coming from a past president of the heating engineers' society, his remarks are quite timely. One of the interesting points brought out was that of the graduates in mechanical engineering at the University of Michigan who have been out ten years or more, 90 per cent. are still in engineering; 34 per cent. are presidents, vice-presidents, general managers, or general superintendents of manufacturing corporations; 39 per cent. are superintendents, chief engineers or sales managers of manufacturing corporations; 7 per cent. are constructing engineers, professors, patent attorneys and in special lines; while 20 per cent. are salesmen, in minor positions or in other lines. In other words, the statistics show that almost 80 per cent. mane good and reach positions of responsibility, and the speaker well asks, "What community of untrained men can show such a percentage of success?"

* * *

Another point emphasized in the address was the criticism that the American engineer is pa to be superficial. In this connection, we believe the following remarks on this topic, made in the course of the discussion of Prof. Allen's address, fairly express the situation and will be a reassurance to many who have, perhaps, envied the thoroughness of the best type of European engineer:

"Because I was raised and educated abroad," said this engineer, "I wish to thank the speaker for his flattering remarks about the thoroughness of the European engineer. However, I think that, on the whole, there is not a great deal of difference, except possibly in the training in mathematics, the European engineer being usually a better mathematician than his American brother. Otherwise, I should be inclined to favor the American methods. * * * Where the European engineer is usually handicapped is in his ability as a business man. His mind is inclined to travel in a narrow groove of technicalities and he often lacks the broad and cheerful outlook on life common to the natives of this country. The reason for this difference, I find, is in the American interest in outdoor sports. Having spent a great deal of his time on the football field or on the tennis court, the young American becomes a mixer, learns to know how the other fellow thinks and feels, and gets the knack of rubbing shoulders with the world at large without getting an elbow in his ribs.

"The European engineer, on the contrary, is usually an indoor man, trained to become a

professor in due season, and taught to keep his nose to the grindstone."

* * *

The Master Builders' Exchange of this city has inaugurated a campaign to increase its membership to 2,000. Hundreds of new applications are already in hand, competitive teams are at work soliciting members, and it is anticipated that by January 10th the membership will be at least 1,000. The campaign was not to have been officially started until January 10th, but the advance interest has so far exceeded expectations that the committee has been forced to consider applications ahead of the arranged schedule.

Special inducements are being offered new members by the Exchange, which is a thoroughly representative body and one doing well and earnestly a work valuable to the builder, architect and material man.

* * *

Ralph Adams Cram, one of the foremost architects in the United States, and well known in this section of Pennsylvania as the designer of the handsome cathedral that is being erected at Bethayres, has contributed an article on "American House Building" to the January "House and Garden." Under the sub-caption, "The Excess of Architecture," he says:

"There seems to us to be two points wherein further improvement is possible, and I am not quite sure that the owner has not quite as much to do in bringing about these as the architect himself. The first is this: Through our increased knowledge, our improved training, our widening view of the world, we are becoming too able and too assured. There is too much 'architecture' in our building, and we are in danger of failing to see the forest because there are so many trees. Of course, this is all natural enough; the owner has the thrifty sense of getting as much good art for his money as his architect can give him, and the architect (if he is not too old and tired) honestly wishes to make each work a masterpiece, an epitome of all he knows—and knows he knows.

"Individualism is rampant, of course, and the commercial sense nonexistent, and the result is pat to be what would be obtained (and is obtained) by a landscape gardener who designs a park but cared only for specimen trees. Economy in the use of art is great virtue. The chateaux of the Loire and Touraine, the piled-up wonders of Elizabethan palaces, are the sort of things that can be done successfully once or twice, but not constantly.

"Opulence has been the ruin of the world now falling in fragments around us. The new spirit that will take control, after the shattering readjustment is accomplished, will be a different thing altogether, and if the world

is to continue at all it will be along lines of simplicity.

"In the new era a little art will go a long way, and successfully, just because it will be so good. The white villas of Italy and Spain, the gray little farms of England and Normandy, the ascetic mansions of New England and Pennsylvania and Virginia give the key. For with them form, texture, proportion, workmanship are everything; ornament and detail only the accent. In much of our best work

there is enough intelligent and admirable design to fit out a community; this is improvident and it is also ineffective.

"If owner and architect will content themselves with the simplest possible expression of the needs of a given case, all in terms of good composition and good workmanship, adding as little detail, as little ornament, as possible, one of the two requisites still absent from our house building will have been attained."

PLAIN TALK ON ENGINEERING SOCIETIES

Some of the shortcomings of engineering societies in general, and of the older ones in particular, came in for a frank discussion in an address delivered by Ernest McCullough recently before the Western Society of Engineers.

Mr. McCullough's address was entitled "The Engineering Society." He reviewed the causes leading up to the formation of the American Association of Engineers and blamed the older societies for not giving more attention to the young engineer.

The technical or engineering societies have not developed with the work of the engineer, he said, and went on to add, as reported by "Power," that these societies are still lingering in the past and consider themselves as institutions organized solely for educational purposes. This is the way they are conducted, but the majority of the members know many societies exist rather as an evidence of the standing of the members than for their declared purposes. The modern technical journal is doing far more real educational work than any society, no matter how large or how important it may be. The pages of the weekly and monthly papers bring to us news from the front, fresh and in a way that the more formal papers of a society cannot. The society proceedings have become mere encyclopedias, which are consulted less frequently than are the pages of the journals maintained purely for profit.

Engineering Bodies Too Often Mutual Admiration Societies.

There is a well-founded idea that engineering societies have for many years past been mutual admiration societies of successful men and have been used for the furthering of insidious advertising by men qualified to take full advantage of the position their membership brings them. The papers are generally obtained only by hard work on the part of the publication committee in each society. The discussions are too frequently inadequate, and real criticism is seldom developed when the author of the paper is of commanding eminence. The young man learns something, but not much, from the papers and feels diffident about discussing them, as he fears his opinion would not be well received.

Needs of the Young Engineer.

The young engineer does not want this. He

wants scholarship, companionship and definite recognition. He is glad to attend a meeting where he knows refreshments will be served, not because of the refreshments, but because something to eat and drink signifies a lack of formality and perhaps an opportunity to mingle freely with older men who have made their mark. He wants to make acquaintances with men having like interests with himself and to feel that the society is more than an editorial body or an encyclopedia compilation of engineering facts—that it is composed of flesh and blood men who want to help him because of their knowledge of the trials and tribulations he is undergoing. He would rather know how to obtain a position and how to hold it than to hear how other men have done engineering work, for he reads the technical journals and gets a surfeit of such material.

The author spoke briefly of the formation from time to time of societies organized by young men and intended to help them meet their particular troubles. In these organizations the employment question is uppermost, and while they may perhaps thrive while times are dull, they all fail when members have positions and forget to continue paying dues. This led up to a discussion of the object of the American Association of Engineers which was originated to raise the standard of ethics of the engineering profession and to promote the economic and social welfare of engineers. These objects are to be obtained by affording means for an interchange of information, by maintaining a service clearing house, by affording patent and legal advice, by supervision of legislation and by proper publicity.

Older Societies Not Attending to Business.

In analyzing the objects cited and the methods by which they were to be obtained and how they conflicted with the objects of the older associations, the author was of the opinion that the older societies were not attending to business. The work outlined should be attended to by the veteran. "Old men for council, young men for action," should be the motto of the older societies. If this were the motto and lived up to properly, the young men should obtain all the objects sought and the societies would grow faster than they are now growing. The members

should receive the worth of their money—the older men in the feeling of satisfaction following every worthy action, the younger men in the experience of material benefit.

Discussing the methods outlined, the older societies can honestly say only the first has been attempted by engineers—that of affording means for an interchange of information. That a service clearing house has not been properly attempted is a reproach. The engineer is a wanderer from job to job. When capital is active he is hard to find. When dull times come and capital rests, the streets are full of technically trained men out of work. They wander from office to office, many of them starving and too proud to admit it, many never getting a substantial footing. Their work is concerned with new enterprises and with the day laborer they share the ups and downs of fortune. There is a place for all, and it is the duty of the older engineers to take care of their brothers. Every day the Western Society and the other large societies delay in organizing a service whereby members out of employment can be placed in positions is an inexcusable reproach. The organization is already formed. It requires only the spirit.

Societies Should Act as Employment Agencies.

Any society should not limit its efforts in this direction to members, but should give members the preference, all things being equal. All members needing men should file their wants with the secretary of the society and not attempt in any other way to secure men until the secretary says there are none available. All members might be classified by specialty and lists printed, so that those wishing to get in touch with men in any special line of work may have such a list given to them by the society and then make a choice.

The affording of patent and legal advice needs to be approached with care. The society should have an attorney who can help members that have trouble in collecting pay. That is, members who fall into the hands of unscrupulous employers.

Legislation for the Technical Man.

The fourth method is concerned with legislation for the technical man. The architects are working hard to obtain legislation to make architecture a closed profession, beginning with the passage of the license law for architects in Illinois in 1897. A number of the States have similar laws, the greater number of which were passed during the present year. Engineers were opposed to legislation to license engineers, but conditions in the State of Illinois became so intolerable on account of the monopoly given to architects that the Western Society this year obtained the passage of a law to license structural engineers. This one thing has done more to help the society than any other single thing since it was organized. The next piece of legislation to be attended to is one fixing the status of sanitary engineers, or the plumbers will get ahead and obtain control of the design and construction of sanitary work. It is not the intention to make a closed profession of san-

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

itary engineering, but to prevent injustice to such engineers because of legislation that may be secured in other lines of work, it will be necessary to have examinations and licenses for them.

Would Register Technical Engineers.

A better way would be to secure a law requiring the registration of technical engineers with an examining board qualified to examine men in different specialties, so that the word "engineer" will possess a dignity comparable with the titles of the other learned professions. Not only must the modern engineering society see that legislation is secured to protect and elevate the engineering profession, but it must also carefully look after proposed legislation to the end that no law which work harm to the people of the State will get on the statute book. That is, as a citizen, the engineer must protect those that lack knowledge of technical affairs and are left at the mercy of special interests.

As to what is proper publicity depends upon changing ideas and advances in civilization. The advertising methods of the live, wide-awake business man may be considered coarse and unbecoming for the professional man. Is this idea a survival of a generation past? Is it, as many young men claim, a fetish worshiped by professional men for the purpose of helping older men maintain their pre-eminence and hold the young man back? The question must be answered individually just now. Throughout his life the technically educated man, the engineer, is at times a professional man, a technical employee and a business man. He must do some publicity work, and society should not be hide-bound in what is to be considered proper means of publicity to be employed by individual members. It should be enough for the societies that the

members remain decent and bring no discredit on the work of the technical men.

The societies heretofore have concerned themselves with the publicity work of individuals. What is now a crying need is publicity work of the proper sort by the societies for the benefit of the membership and incidentally of the technically educated men not members of any society. Through proper publicity work all technical men not members will want to become members. Incidentally, the work of technical men will be so placed before the public that there will

be an increase of good material in the ranks. Proper publicity should have the effect of sifting out desirable men from those not so desirable. It is because of improper publicity work that there are so many complaints today of too many unfit men enrolled as engineers. These men, no matter how unsuited they may be to the work of the engineer, have a place somewhere in the world where they can fit in, and it should be part of the duty of the engineering societies of the future to find the holes in which these misshapen pegs may fit.

HOME PLANNING

It is not a very difficult matter to plan a house, but the planning of a "home," in which you shall realize your ideal of what that word means, is not so simple, since the completed building should reflect your personality as well as suit your individual needs. A building that is a home to one might be merely a house to another, as it would not portray the personality nor suit the mode of living.

The successful house must be successful in all its details and within the limitations imposed by the builder's purse. The general scheme must embody the most careful study of the builder's needs. A long and careful preliminary study of the problem from the standpoint of yourself and your family will enable you to decide what you must have, what you would like to have and what you are willing to do without if the purse so rules. It is well to collect and arrange in some convenient and orderly way the many illustrations and plans that are published from time to time in papers and magazines and which may suggest something for your particular problem.

Although it does not come strictly under the title of this paper, we should first of all consider the lot or site, it being taken for granted that the lot has been obtained. The next step to consider is the making the most of it, keeping in mind its surroundings and its possibilities for pleasant outlook and privacy for main rooms. If it is an inside lot, narrow and deep, as the great majority of them are, it means that either the front or rear must be used as garden or lawn upon which the living rooms shall open.

A common fallacy is that a south or east frontage is preferable to one having a street outlook to the north or west. This is due largely to our mistaken ideas of front and back yards.

Much more pleasure can be gotten from the yard or garden at the rear away from the street with its dust and noise, than from one at the front that is divided by the entrance and service walks and limited in depth by the short distance the house can be placed from the street because of the location of neighboring houses.

Of course, it must be remembered that we

here speak of a garden that is a delight to the eye and not a utilitarian garden cultivated for the benefit of the inner man. The vegetable garden and service yard can be placed farther to the rear or at the side and should be screened from the other.

A corner lot of course lends itself to more convenient planning and more open and sunny exposures than the inside lot.

These points are brought up to show their importance in relation to the actual planning of the home as the various rooms must be placed so as to take advantage of these things.

The next consideration is that individual requirements, being careful that they do not overrun the appropriation as it is hard to make a \$5,000 appropriation cover a set of \$8,000 requirements. We deal here with the problem of the moderate sized house which requires careful thought because of its many requirements and limited cost.

Having determined the proper location for the main rooms by keeping in mind the general outlook or prospect from the house, the direction of prevailing breezes in summer (which is usually south or southwest) and exposure to the sun, first consider the simplest form of plan, the rectangle with corner entrance.

The living room should have southern sun and the dining room east sun for breakfast in addition to the south exposure if possible, but the latter is not so much for the warmth and cheer of the winter sun as for the cooling breeze of summer, which can be gotten also by proper openings between rooms.

This almost determines the location of the living room at the south or southeast and dining room at the northeast, and since connection between kitchen and dining room cannot be severed, the kitchen must come at the northwest, and the entrance hall at the southwest corner, the least desirable corners for rooms. Where the width of lot allows a central entrance one must determine whether or not individual requirements or natural conditions such as shade, etc., will allow the living room across the west side, in which case the dining room will come at the southeast and the kitchen at the northeast.

In a case like this if the entrance is north

we have an ideal scheme for the private garden at the rear with both main rooms looking out upon it. We cannot, of course, consider here all of the innumerable arrangements that may be evolved.

Having arrived at what seems the most feasible disposition of the main rooms one must consider other things that make the successful plan.

Keep in mind the diverse points between which most traveling is done and endeavor to bring them together without conflicting and without necessity of using one room to reach another. There should be direct, but independent means of reaching the front entrance from the kitchen and yet the kitchen should be isolated to prevent the odors permeating the whole house. In order to accomplish this it is well to have two doors intervene, either in a pantry or passageway. The planning of a convenient kitchen could easily take up a whole paper in itself. Formerly a part of the house back of the dining room was merely left for the kitchen without much thought about the arrangement of range, sink, cupboards, pantry and refrigerator with a view of saving steps, or of getting the proper light, cross ventilation, etc., and besides it was usually too large. Now the architect and housewife are co-operating more and more in working out this very important department of the home.

A properly planned small kitchen will suffice for a good-sized house, but its size is dependent somewhat on the number of people that will work there at the same time and upon the amount of entertaining that it is expected to be done. Think of the operations to be done in the kitchen and place the fixtures so that needless steps are eliminated. Try to keep the fixtures as nearly contiguous as possible to prevent the travel from doors breaking up the working area. Place the sink in a good light as near the dining room entrance as possible and don't forget to have it high enough. Thirty-five or thirty-six inches from floor to rim is about right. Place the range where it will get good light and cross ventilation, although not direct drafts, and have the mixing table and some serving space adjoining.

The amount of cupboards in the kitchen itself will depend upon whether or not there is to be a serving pantry. If not, it means ample cupboards and serving space in the kitchen.

The cupboards can be designed for their special uses; place for platters, trays and special dishes; spice compartments and flour bins; place for the cook books, for the bread and mixing boards, for the table leaves—in short, a place for everything and that nearest to the spot where it is to be used. If possible keep the refrigerator space away from the heat of the sun and of the range and so it may be iced without dripping the ice through the kitchen—preferably by means of an outside icing door. The cool pantry is sometimes eliminated and the face of the refrigerator built in flush with the kitchen wall with an outside icing door. It takes more ice, but

steps are saved. It is not always possible but it is desirable to arrange access independent of the kitchen to the basement for the man of the house.

The stairs are one of the few things that will not admit squeezing and ample room must be allowed for them. If rear stairs are out of the question, provide as private a path from kitchen to main stairs as possible.

The second or bedroom floor is of course dependent for area upon the first floor, but it must be planned and not allowed "to happen" as so many appear to be.

Of course it is the problem of getting as many rooms as will fit in without any waste space, but each room should be considered for its use, whether for owner, child, guest or servant, and furniture and closet provisions made accordingly.

For sake of economy the bath fixtures should come over the plumbing below, but there are times when it is false economy to spoil a desirable corner with the bath room when it fits logically in a more convenient place, often next to the owners' room. In the bath room provide a built-in medicine cabinet and a cupboard or closet for towels.

One scarcely needs to mention the closet for linen and bedding, the place to keep the brooms, the portable vacuum cleaner, the upstairs ironing board, etc.

Outdoor sleeping has become so general now that nearly all homes require a sleeping porch. It should be situated so as to get the summer breezes and yet it should be sheltered from the north and northwest winds of winter. Even a north or west exposure can be overcome by sash. There are good sash on the market now which are hinged together in pairs and open out where they are out of the way, yet are rigidly braced against the wind.

The sleeping porch, under the main roof of the house, as an integral part of it, usually has much better appearance than one above a first story porch, as the latter is apt to float and not have a tied-in appearance.

Porches in general may be considered to serve two quite different uses; as sheltered entrances and out door rooms. Rarely are those two functions successfully combined, as its use as an outdoor room demands privacy. It is best to have a small shelter at the entrance and then place the living porch where it will give the most comfort; off both the living room and dining room if possible. The living porch on the east side of a house will get the south sun and breeze and will be shaded by the house from the hot afternoon sun, but avoid darkening the rooms by a porch across all the south windows.

Here again the purse limitations come in and we may be compelled to plan so that screens and sash and perhaps heat for winter will have to come later, but make provisions for them.

Another thing must not be forgotten; that is the height of ceilings. The lower story should not be over nine feet and even less height will tend to give the rooms a larger and cosier look that is worth having. If the

ceilings are beamed be careful not to get the beams too deep or too close together, as they will give a heavy appearance. Eight feet or eight feet three is a good height for bed rooms. Of course in very large houses heights must be increased somewhat.

Many other things must be thought of in laying out your plan, such as fireplace, heating, electric wiring with its outlets for the many electrical appliances, the basement with the dust of the heating plant shut off, and the laundry and drying room and a fruit room away from all heat, the attic or storage space, etc.

The layman planner cannot be expected to arrange all these things to his entire satisfaction, but if he gives his problem close and serious application along these lines he will be able to work out a scheme that will show the architect along what line to develop the finished plans. But always keep in mind your family needs and peculiar requirements.

It is not in the province of this paper to discuss seriously the exterior design of the home, for it is the plan that is the important thing, and it must govern the elevations. Each, of course, must make some concessions to the other, but one will find that if a good plan is evolved after careful and painstaking study, the elevations will take shape without undue strain or effort.—H. W. Whitsitt in "The Ohio Architect."

RECORD ERECTION OF GIANT HYDRAULIC PRESS.

"What is believed to be a record for the fastest time ever made in erecting a large hydraulic press was recently established at the new plant of the Knox Pressed and Welded Steel Company at Wheatland, near Sharon, Pa., says "Iron Age." "This press, which weighs 160,000 pounds and is capable of exerting a pressure of 400 tons, left the plant of Mackintosh, Hemphill & Co., Pittsburgh, on a special train consisting of a locomotive and two cars at six o'clock on the evening of November 30. The train reached the Knox plant shortly after midnight and the press was unloaded, set up and grouted in place by the afternoon of December 2, or in less than forty-eight hours from the time it left the builder's plant."

There never was, never will be, a better medium for the man who has something to sell to a given class of buyers than the trade paper whose circulation is limited to that class. Newspapers with their swollen circulations strike at best but a chance target here and there. The trade paper carries your rifle fire to targets exclusively. You can't miss,—if your ammunition's right.

Do you get "The Guide" regularly? You should. Better subscribe now, while you think of it, and keep in touch. The man who fails to get and to read carefully the trade paper of his chosen line, is missing a while lot of valuable data that should be at his command.

THE ARCHITECT AND THE CLIENT

A Banker Speaks on the Subject

(Abstract of an address delivered by Mr. Oliver L Farge to the members of the Architectural League of the Pacific Coast at Seattle, Washington.)

Notwithstanding the fact that I live close to two architects and I have one in my family, I am perfectly amicably disposed toward the profession, and may truly say that I always have dwelt in good relations with its members. I may say that I expect to do so until such time as I shall build something of my own.

While I say this with a frivolous revelry and abandon, I note that you assume that in it there lies concealed a subtle something, about which I am going to trespass on your good nature and amiability.

One is not often given a chance to talk to architects and tell them, as a crowd, just what one thinks of them. I am somewhat peculiarly situated in regard to this. I have worked in an architect's office and have studied architecture and building and am one of those so-called business men who are supposed not to know the aims, ambitions, and hopes of the men of your profession, and am also one of that body of men who continually offend by refusing to recognize the ethics of your profession.

Perhaps it was fortunate for me that I was brought up in the atmosphere which was always redolent of the carnage of battle between the artistic temperament and the commercial temperament, and I am quite sure that I am not mistaken when I say that there is a great deal to be said on both sides of this question, and that there is a great deal that has been left unsaid by the architects, which in duty to themselves and to the public requires to be said.

You may have noted a remarkable fact in regard to the average American business man, in that there is no question which he feels quite as unable to master easily as the question regarding art or architecture. This feeling is largely due, of course, to unfamiliarity with the subject as well as to a contempt for its mastery—a feeling which has been engendered by an exclusiveness of aim and attainment on the part of those who practice it. It seems to me that it is possible to bring about a more complete understanding of your work and its necessities by the adoption of a few simple principles, one of the first of which is that the public be made to understand the architect's point of view.

We must remember that all professions dealing in imaginative qualities of work have had, from time immemorial, difficulties of understanding as between principles and clients, and architecture has this difficulty because, if the client had these qualities, he need only employ a carpenter or builder.

Perhaps you may remember how indignant was Michael Angelo when he overheard the

Pope and one of his advisers criticising his work and methods, and how his indignation got the better of him and he upset the paint on their heads from his scaffold.

Perhaps we can go further back than that, even to the remote ages, and remember the sadness of the ancient Chinese painter who, overwhelmed by continuous criticisms and misunderstandings, retired into the painting which he had made in order that he might retain his peace and happiness.

All our earlier artists and architects suffered from the universal lack of knowledge of art and from an improper understanding of its necessities; but, in spite of that, and, I might say, by favor of that, they were able to produce lasting things.

Richardson suffered from this as much if not more than any architect, and I could cite you numerous cases of apparent disregard of the feelings, opinions, or intelligence of architects, artists, and sculptors.

Almost universally, may it be pointed out that an understanding would have been easily possible provided the professional man had been willing to unbend and become a teacher to his client.

In all cases you will find that the impatience of the so-called practical man of affairs with the imaginative qualities of architects is due in part to three or four things:

First. Lack of knowledge of the cost of drawing.

Second. Lack of explicit determination of what the client is paying for.

Third. Lack of imagination—that is, lack of understanding—of what the architect's function really is.

Fourth. Lack of evidence of commercial return on good design as well as planning.

Now as to the first: It is a problem how to get this into the lay mind, but I assure you it can be done if the architect himself keeps a cost account of his draughting as he should; yet there are many architects who do not keep such a cost account and therefore cannot explain to the client in details of dollars and cents and hours and minutes. If they keep such a system, there is nothing that will interest the commercial client more than an exposition of it.

Now as to the second: A definite method of charging is professionally correct and should be adhered to, but the public usually misunderstands what is meant by supervision, and wherever you find a client you will very likely find him confident that he is not getting the supervision to which he is entitled. I believe that a complete understanding on this point before proceeding saves many difficulties and much expense to architects.

Now the last two difficulties, which are really due to a lack of education, can be remedied (and I believe they have been somewhat remedied), first, by keeping to the standard of your profession and demanding recognition of your standards, and also by a constant exposition of the work of the architect, what he has done for the community and what he can do, and what he supplies that the other man lacks.

It has seemed to me that a practical book, on the plan of Mr. Richard Hurd's book on real estate values, would be of great value not only to architects but to the public. I presume many architects are familiar with that book. It gives the history of city growth, and the land, building and rental values of many cities which, of course, are closely related to the question of proper planning. It gives many examples in photographs of rental values sacrificed by architectural blunders in planning, and on the whole, I think there has been no book written on that subject as good as this one.

My own business is mortgage banking; that is, savings deposits invested in city mortgages. To us, during periods such as we have had in the last few years, the only real basis of appraisal of real estate for mortgage is the rental basis, because of the lack of sales of real estate. The rental basis of a loan depends in part upon the good planning of but the major portion depends upon good the building, and in part upon its location, planning. This depends upon the architect. So, you may see that after all we are closely allied—if you do good work we can do good work—and just so much as a savings bank is able to invest its funds wisely and safely in a community, just so much better and richer is that community; it is being constructed by its own people, and is just so much more able to employ good architects.

I believe that architects, as a rule, are the best professional men of any community. I have always found them alert, filled with civic pride, and very human, and the most delightful men as friends. I have usually found them controlled by two very strong motives; a constant wish to do honor and justice to their profession, and a desire to please their clients, of course not counting the anxiety we all have to get the job. The control by associations is a good thing, but I beg you to remember that your client cares nothing for rules and regulations, and you must educate him to a belief in your capabilities, and not present him with a printed slip of what the Institute decrees professionally. You can do this now, where you could not do it twenty years ago.

There are occasional lapses by the public, but the emphatic expression of outrage by the people of the world at the recent destruction of the architectural monuments in France and Belgium must convince you that the people are generally assured of the value of good architectural work.

My conclusion is that the successful architect is the one who can handle the public without offense to its sensibilities, and still cling to the high ideals of his profession.

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation. Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases.

Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

For every "one" man you can mention who has succeeded without advertising we'll agree to name ten whose greater success has been due to advertising "direct." Moral Advertiser!

PLACE AND VALUE OF THE TRADE PAPER.

"Eloquent speakers who have preceded me have told of the greatness of our American industries, and have rightly given to advertising a large measure of credit for our industrial and commercial supremacy.

They have spoken of the daily and weekly newspapers, the agricultural press, the magazines, the billboards, the street cars, and even the advertising novelties, as the forces that have played an important part in this wonderful upbuilding, but they have wholly missed the greatest force of them all—the trade and technical press of the country."—R. R. Shuman before the annual convention of the Associated Advertising Clubs at Omaha.

REAL GOLD UNMINED.

"I am here as the self-appointed representative of 900 trade and technical publications printed in the United States and circulated wherever the English language is spoken. How important they are in their relation to advertising may be understood when I tell you that they carry, in the aggregate, advertising to the amount of at least \$25,000,000 a year—one-eighth of all the advertising money that is spent for all forms of publicity in the country—and that these advertisers "stick" year after year because it pays them to stick.

I have bought, sold and written all kinds of advertising—pasted and printed, indoor and outdoor, consumer and dealer, technical and commercial—and I have reached the conclusion that there is more real gold as yet unmined in the trade press field than in any other field of advertising endeavor."—Extract from address by R. R. Shuman, before the annual convention of the Associated Advertising Clubs at Omaha.

Don't expect outsiders to give you a big rating on a one-inch space.

SOME MORE ADVERTISING "DON'T'S."

Don't try to do a million dollar business on a two thousand dollar basis.

Don't try to advertise a quarter page proposition in a three-inch space.

Don't belittle a big business reputation by running a piking little "ad" among piker competitors.

Don't overlook the fact that as a man is judged by his stationery, so a firm is judged by its advertising.

If you can persuade people to buy your goods you make money. "The Guide rounds up in its clientele the people you want to persuade. A certain amount of space and the right kind of selling argument does the rest.

There never was, never will be, a better medium for the man who has something to sell to a given class of buyers than the trade paper whose circulation is limited to that class. Newspapers with their swollen circulations strike at best but a chance target here and there. The trade paper carries your rifle fire to targets exclusively. You can't miss,—if your ammunition's right.

Do you get "The Guide" regularly? You should. Better subscribe now, while you think of it, and keep in touch. The man who fails to get and to read carefully the trade paper of his chosen line, is missing a while lot of valuable data that should be at his command.

THE INHERENT QUALITIES OF BUILDING MATERIALS

An Exposition of Considerations Governing Choice

The first thought of building materials usually flashes before the prospective house builder a variety of media, each one of which, he has been confidentially told by different friends, is incontestably the best.

The question of choice, happily, is not untrammelled, but is actually limited, even when considered in its entirety; and this choice is further simplified by several very definite factors, such as cost, appropriateness and locality. The greatest confusion, perhaps, results from ideas not clearly visualized, and satisfaction in the ultimate choice should be reasonably certain if the prospective builder saw each material with its exact qualities, unshrouded by mystery or unfamiliarity. It is the purpose of this article, then, to establish certain specific premises in a carefully defined manner, confining the discussion, for the sake of simplicity, to materials used for the exterior structure of the house. The interior presents considerable complexity, and might better form the subject for separate consideration.

Let us establish two distinct sets of considerations of exterior building materials: the first, practical, involving cost, locality and stability; the second, esthetic, involving appropriateness, expression, color, texture and the like.

While it is, of course, advantageous to know what one wants, it is advisable (as well as often necessary) to let desire be governed somewhat by the first, or practical set of considerations.

Obviously, stone, brick or tile houses cost more than frame houses, but are at once permanent and comparatively fireproof. A house of fieldstone, in a brick country, would naturally cost more than a brick house in the same locality, and a brick house on a mountain top, or a remote seashore would be more expensive than a stone or frame house in such places. These are factors dictated by local individual conditions, seldom similar unless expenditure is no object, though from the point of appropriateness, local materials are more to be desired than alien materials. A brick house on a gray New England seacoast is unpleasantly conspicuous—but this is covered under the second set of considerations.

It is manifestly impossible to give a fixed table of comparative costs, owing to varied local conditions. One cannot say, "A brick house will cost you less than a stone house," either at Trenton, N. J., or Marblehead, Mass.

An approximation, however, is possible, and can serve as a partial index in the cost phase of materials. For specific local conditions rough allowance may be made, figuring a few hundred dollars more or less according to the nearness of given materials to the site. Further variations, difficult to allow definitely,

but comparatively slight, will result from local labor conditions.

An experienced builder, Mr. E. Wyatt Blanchard, has kindly assisted in the presentation of the following table of comparisons, the figures being given on a minimum unit of \$10,000, and with the hypothetical assumption that local conditions are as nearly as possible the same.

Type of Construction.	Cost of Outer Wall.	Total.	Increase.
Frame, Shingle-covered	\$945	\$10,000	
Frame, Clap-board-cov'd	985	10,040	.004%
Frame, Stucco or Wire Lath	1,171	10,226	.0226%
Hollow Tile and Stucco	1,626	10,681	.0681%
Brick	2,217	11,272	.1272%
Stone (Rough-dressed)..	2,991	12,046	.2046%
Actual Half-Timber...	3,491	12,546	.2546%

The question of stability is to be regarded as comparative—one assumes that a house of any type above will stand up, and will be weather-proof. The question is rather intended to involve the qualities of permanence, low maintenance and impervity. If low maintenance is desired, the initial cost of the house is naturally greater. To be impervious to weather, the walls of a house should be of brick or stone, its roof of tile or slate, the fittings about the chimneys and at the junction of roofs, called "flashings," as well as gutters and rain-pipes, should be of copper or lead, and the windows should be lead casements, set in lead frames in the masonry. Here would be a structure no exposed part of which could deteriorate in more than a century. English houses so built a good many hundred years ago have still the same flashings, casements, gutters and rain-pipes that were built into them. Such construction is naturally expensive, even allowing that it requires no maintenance, and at best we have to-day some parts of our houses that require occasional replacement or constant protection.

The frame house, well built and properly cared for, will last several generations, even in the destructive climate of our North Atlantic seaboard, as is evidenced by many of the ancient and proud old houses of New England—one boasts 279 years, and is still in prime condition. In salt air shingles become so hardened as almost to cease to be wood.

Brick and stone endure forever, and need only very occasional "pointing" if the mortar has disintegrated in some of the joints. With properly mixed cement mortar this necessity would not occur in a lifetime.

Stucco, as used in some parts of this country, is, comparatively speaking, new, and its condition after several hundred of years can be vouched for only in California, the South and Southwest, where climatic conditions are similar to those of Italy and Spain, where the

stucco house is as venerable as any existing. The permanence of stucco for exterior use is almost entirely dependent upon the knowledge and care with which it is mixed, and the honesty with which it is applied—considerations wherein too much care and insistence cannot be exercised.

A few years ago, there was a good deal of talk about the house of solid concrete. Concrete in itself is an excellently permanent material, and invitingly inexpensive, but its use involves the use of complete and elaborate "forms" into which it is poured. A wall here and there, an arch or pergola or exterior stair or terrace may well be built of it, but an entire house of concrete involves the cost of a large bill of lumber for "forms" to be thrown away or allowed for a fraction of its cost, to the contractor. As the "forms" leave unsightly joints and impressions, several wash coats of stucco or cement are further necessary before the house is decent to look upon.

A rare type of construction in this country, but one which is now coming into considerable attention, is real half-timber work. Its expense has been its greatest drawback, but its picturesque and structural merits have caused this to be overlooked. For many years "half-timber" has been used to describe the imitation—thin boards nailed to form patterns on stucco houses. The esthetic morality of this device (which cannot be called a "method or construction") falls under the second, or esthetic set of considerations. Actual half timber work, however, is construction—construction expressed in the exterior aspect of the house. A real half-timber house, or gable, shows the actual timbers of the house exposed, with the interstices filled in or "nogged," as the English call it, with brick. This brick may either be used decoratively to show, or may be covered with stucco.

Briefly, these constitute practical essentials involved in the choice of the materials mentioned, and the discussion now turns to the second group of considerations—embracing all that is included in design with reference to material. These considerations were given as appropriateness, expression, color and texture.

The first two are cognate, though appropriateness is the broader, and may be taken to imply natural suitability to location and stylistic suitability to design. Expression involves only the rendering of a given style. Natural suitability to location was touched upon before, and may be dismissed with the general statement that preference should be given wherever possible (and regardless of the cost consideration) to strictly local materials. It is to the use of local stones, bricks, slates and tiles that much of the charm of the English country house is due.

Generally speaking, it is well to design in materials of a similar nature—that is, to adhere to wood consistently, or to impervious materials. One often sees a house of which the walls of the first story are stone or brick, and the upper walls wood. This is frequently the result of limited expenditure. Good com-

Editorial Comment

The opinion is general among Philadelphia builders that 1916 is destined to be a record year for new construction. The fact that the total of expenditure upon new building during 1915 reached the impressive sum of approximately \$50,000,000, and that a very considerable percentage of the work embodied in this total will lap over into the new year, adding to the normal activity of the opening months, has had a quickening and stimulating influence in every avenue of the building trade. Buttressing this hopeful and reassuring outlook is the extraordinary and undiminished activity observable in various lines of manufacture, notably the iron, steel and related industries. The circumstance that a large proportion of the new work under way is for manufacturing buildings or for additions to existing factory plants goes to show that the prosperous conditions indicated are not artificial or forced, but are due to a natural expansion based on increased demand in certain lines.

It is encouraging to note, in this connection, that the expansion of resources is not confined exclusively to concerns engaged in the manufacture of war material, but extends to trade channels such as would not seem to be in any close sense related to these.

Architects in and about Philadelphia are, with few exceptions, busy with work enough to keep them going for months to come. Home building, one of the safest of barometers by which to gauge the trend of economic pressure, continues to show a healthy and growing demand, evidencing prosperous conditions among people of the working and middle classes. Viewed, by small and large, the new year gives every promise of being a year big with the possibility of new records in the field of structural activity.

* * *

As a straw indicating trade opinion with regard to the building outlook, nothing could be more reflective of the general optimistic feeling which prevails than the campaign inaugurated by the Master Builders' Exchange to infuse new life and blood into the membership of this fine, old representative building organization. For many years one of the institutions of Philadelphia and a tremendous agency for good within the zone of its influence, the Exchange has made little or no effort to attract to it the hundreds of new men who have pushed into the sphere of its activities. Doing a most commendable work along conservative lines, the Exchange has been content to depend upon the splendidly representative character of its personnel, its commanding position in the trade, and its notable permanent exhibit to bring to it such additions to its membership as might be necessary.

Within the past month there has been an awakening such as foreshadows great things

for the future of the Exchange. Membership teams are at work in a systematic campaign to add 1,000 new members within three days. This campaign opened on Monday last. It closes to-day with every prospect of success.

A more enthusiastic group of old, middle-aged and young men has never before united for any great work—great because the Builders' Exchange always was, is and ever will be one of Philadelphia's greatest organizations, and to be engaged in a work that will tend to increase its efficiency is indeed doing a noble deed.

If we are patriotic citizens and look upon our many monumental buildings with admiration and enjoy the comforts of a well-built home, we cannot help feeling a deep interest in the creators of all these things, "the master builders."

E. J. Cattell, the city's statistician, as the principal speaker at a recent dinner given by the Exchange, and told in a spirited address some real truths about Philadelphia and its builders, and predicted that the year 1916 would be one of the greatest years for the building trade in the history of the city. He also impressed upon the members of the Exchange the necessity for a strong organization to be prepared for big business.

W. Nelson Mayhew, chairman of the Membership Committee, is the human dynamo behind the movement to make Philadelphia's Builders' Exchange the biggest and most influential in the land. He has succeeded in getting the builders whose contracts run into the millions to join hands with the youngsters for the common good of the campaign. Mr. Mayhew in his remarks pointed out the many advantages of a Greater Exchange and what it means to Philadelphia, particularly to the wage-earners, who will profit greatly when the city opens its pocketbook for the building of factories, public buildings and new dwellings.

Fifty "two-men" teams have been selected to do the work. They have in hand the names of 3,500 prospects, and Messrs. Contractor, Sub-contractor and Material Man, if you are not already a member, get your pencil sharpened to sign your name to a membership card for a Great Builders' Exchange.

* * *

The purpose of the campaign at this time is to organize the builders of the city for what they believe to be one of the greatest eras of expansion the city has ever known. They estimate that this city will spend more than \$200,000,000 for buildings next year, and they want to be ready for the work which is coming their way.

* * *

An interesting feature about a new structure to be erected at 50 West Sixty-seventh street, New York, says the "American Con-

tractor," is that one section has been especially designed for the tenancy of musicians. The architects have adopted the latest sound-proof contrivances with a view of blocking the sound of a multitude of musical harmonies or otherwise before they can reach the occupants of a neighboring apartment who may desire quietude.

* * *

New York City builders and realty owners have been fighting for some time past the system in that city whereunder inspections have been needlessly and annoyingly duplicated. That the fight to eliminate much of this divided official meddling has borne fruit is shown by an article in the current number of the New York "Record and Guide."

"Yielding at last to the pressure of public opinion, if not to the necessities of the case," says the "Record," "the State Industrial Commission has consented, on the motion of the Joint Committee of Architects, Engineers and Builders, to accept from the Superintendents of Buildings certificates of examination and approval of plans and specifications of factory buildings in conformity to the State Labor Law. When plans are held at the Building Bureau for examination under the Building Code of the City of New York they will be examined at the same time to see that they are in accordance with the New York State Labor Law when the building is intended in whole or part for factory purposes. This will avoid duplication of inspection work and save the owner and his architect from the inconvenience of having to submit the plans for examination at the State Factory Bureau as well as at the Building Bureau of the borough.

"Only a few weeks ago the State Industrial Commission, which presides over the State Department of Labor, repeated, through Commissioner Lynch, with new emphasis its insistence that the safest way to build for factory purposes was first to obtain the approval of the commission, otherwise upon the completion of the building and its inspection by the State authorities expensive alterations might be necessary in order to bring it into compliance with the rules and regulations of the commission. No jurisdiction was claimed for the Department of Labor over a building in course of erection, but there was a strong intimation in the words of Commissioner Lynch that the owner would by following this course protect himself from annoyance and expense.

* * *

"On the part of the State Industrial Commission, the Superintendents of Buildings in this city, and the Joint Committee the understanding now is that the inspection of buildings of the class referred to, as of other buildings, during construction, shall be in charge of the local building bureau having jurisdiction, and upon the completion of the structure the Bureau of Inspection of the State Industrial Commission will supervise through its inspectors the maintenance of the building in compliance with the factory law. Details will be arranged by a committee representing the

several interests, and rules will be promulgated for the information of the public.

"This is a step toward the amalgamation of building inspection that comes upon the eve of mandatory legislation to that effect. A bill prepared by Commissioner Adamson at the Mayor's direction will be introduced in the Legislature for bringing together into one bureau in each borough all the duties connected with the examination of plans and the inspection of buildings of every class during construction. It will also provide for bringing together into one central department of the city government all the powers and duties of the several departments now having jurisdiction over the maintenance of buildings. The present expectation is that this measure will not only have the approval of the Mayor, but also of the Borough Presidents, the Conference Committee of Real Estate and Commercial Organizations, and the Tenement House Committee of the Charity Organization. And as its essential principles have already been agreed upon its passage by the Legislature is, for that reason, well assured.

* * *

"The action of the State Industrial Commission is fully provided for in the existing labor law, which authorizes and permits, but does not direct, the commission, as the successor of the former Labor Commissioner, to accept certificates from the local building inspectors in lieu of actual examination of plans by the engineering division of the State Commission. But it is hoped that the Mayor will not by this delayed concession be turned aside from his intention to obtain mandatory legislation for the consolidation of all inspection functions. The State factory authorities have been extremely persistent hitherto in grasping for new and arbitrary powers over real estate. They have usurped functions which they were unable to perform and have imposed obligations upon owners which at times amounted to hardships. While the State Legislature is in the mood to curb State interference of every sort with what rightfully are local functions, the city administration should not cease to press for legislation that will insure permanent relief."

C. C. SCHNEIDER DIES; NOTED AS ENGINEER.

Charles Conrad Schneider, civil engineer and one of the foremost bridge experts of the country, died on Saturday at his home, Upper Osborne, above Wissahickon.

Mr. Schneider was born in the Duchy of Saxony, Germany, 72 years ago. He was an ex-president of the American Society of Civil Engineers, and for years was chief engineer of the Pencoyd Iron Works. At the time he fell ill he was chief engineer of the American Bridge Company and had been acting for several months in the capacity of consulting engineer at the large Quebec bridge in Canada.

Mr. Schneider graduated from the Royal School of Technology, Chemnitz, Germany, in 1864. In 1867 he came to the United States and became associated with the Rogers Loco-

motive Works, Paterson, N. J., and later became an official of the Michigan Bridge Company. During his career he was member of the consulting committees for many of the large bridges in New York City and State. The Fraser River bridge, on the Canadian Pacific Railway; the Niagara River cantilever bridge, and the Stony Creek viaduct, on the Canadian Pacific Railway, were among his achievements.

In 1886 Mr. Schneider was awarded first prize for the best competitive designs for the Washington bridge across the Harlem River in New York. In the same year he received the Rowland prize from the First American Society of Civil Engineers for his paper on the construction of the Niagara River cantilever bridge. In May, 1886, he became associated with the Pencoyd Iron Works, of this city.

THE INHERENT QUALITIES OF BUILDING MATERIALS.

(Continued from page 27.)

binations of material are: brick and stone, brick and stucco on hollow terra cotta blocks, and all the impervious materials may be combined in one building—brick, stone, tile and stucco.

In the matter of appropriateness of material to style, success has very seldom been attained in building a house of a given style in a material not characteristic of that style. Certain styles are definitely associated with certain materials: Spanish and Italian houses are of stucco and tile, with details of wrought iron; French houses of the formal type, of cut stone and slate; "Colonial" houses, small, of wood with shingle or clapboard, or of fieldstone, plain or roughly stuccoed and large "Colonial" houses of brick, or of wood. The California type is either of stucco, after the fashion of Spanish and Italian houses, or constructed somewhat after the manner of Japanese houses, with timber very colloquially used. Of all types of house, the English is least characterized by any specific material, and is more than any other composed of a variety of materials in one building. There are English houses of brick, rubble-stone (not used like our fieldstone), wood, half-timber and stucco, which the English usually call "rough-cast," and with roofs of slate, tile, shingle or even thatch. It is because of this variety in material that the English house has developed along distinctively picturesque lines, and because the English architects seem more familiar with varied materials, and more ready to use them in free combinations that the English house is peculiarly interesting.

Expression is naturally involved in this question of style, the choice of material being governed by the kind of architecture which it is desired to express. As part of the tools of expression, there are qualities of color and texture in materials to be reckoned with.

Brick, to-day, exists in a range of both colors and textures practically unlimited. Stucco is also a flexible medium, which may be colored or tinted in many hues and shades

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

and may be applied with textures ranging from perfect smoothness to the utmost roughness. Broad expanses of stucco are often relieved by a decorative expedient ordinarily called "half-timber." The demerit of the expedience lies only in attempts to confuse imitation with real half-timber work. If it is borne in mind that stained strips of wood, applied on a stucco wall or gable end, in patterns resembling half-timber work, are so placed only for their decorative effect, and with no intent to deceive, there is nothing wrong in the practice. An effect of half-timber work, not a deceptive imitation, is often essential in the design of small houses where in the actual construction would be impossibly expensive.

Reverting to the premises at the head of this article, materials, then, should be considered first along lines of practicality and appearance. Practically they should be selected with due consideration of cost, locality and stability. From the point of appearance, they should be selected as characteristic of the architectural style chosen for a given building, and as calculated to best express that style in their physical terms of color and texture.—C. Matlack Price in "Arts and Decoration."

ABSOLUTELY NECESSARY.

**We may live without poetry, music and art;
We may live without conscience and live without heart;
We may live without friends, we may live without fads;
But business to-day cannot live without ads.**

Once-in-a-while advertising is like once-in-a-while eating. Good in its way, but decidedly not nourishing.

A MANAGER'S VIEWS ON LIGHTING

Daylight gives to man nature's illuminative medium, with which he is able to do his best work with the least fatigue. The rotation of the earth azords alternate periods of light and darkness, allotting to man the alternate periods of activity and rest requisite to his constitutional temperament.

It is in the problems of illuminating places where men are concentrated into relatively small economical areas, such as we find in the modern city buildings to-day that building managers are vitally concerned.

To do this work properly and completely, the illuminating engineer should commence his work coincidentally with the preparation of the plans for the erection of the building, and should be made responsible both for the efficiency of natural illumination as well as that of artificial illumination. To obtain the best results the two must be considered together, not independently by dizerent engineers.

As natural light is of primary importance, the windows of a building should always be designed so as to afford the most useful inflow of daylight. Large windows do not necessarily accomplish this. Large windows are often a source of annoyance, and make it necessary to use artificial illumination during daylight hours simply because care has not been exercised in their location and design to take proper advantage of surrounding conditions.

Windows placed low down in a room—that is to say, with the top of the sash relatively far from the ceiling and the bottom relatively close to the floor, are very inefficient even though the windows may be large. The reason for this is that much of the light falls below the working plane, while the level at which the light is admitted is more directly in line with the normal line of vision—which is generally at an angle declining below the point of sight. The effect of this is to contract the iris and lower the seeing power. This makes a double loss, maximum illumination thrown below the working plane, restricted seeing power imposed upon the eye.

North Light the Best.

It is a well-known fact that windows which face the north afford the best kind of illumination. The reason for this is the absence of the distributing effects of the sun's rays. With windows facing north, awnings and shades are not necessary, therefore at all times maximum light admission is afforded. Good results could be obtained by the use of properly designed prismatic windows. Prismatic glass could be designed and installed so as to turn the sun's rays from the angle of impingement up to the ceiling and the useful light would be reflected therefrom. It may be possible to accomplish good results not otherwise obtainable by facing windows, instead of parallel to the face of the wall, at a slight horizontal angle to the wall, so as to admit a minimum of the direct rays of the

sun. Combinations of angularly placed windows and suitable prismatic glass may be made to secure results approaching northly exposed windows.

Artificial illumination has received closer scientific study than natural illumination. But even with respect to artificial illumination it may be safely stated that consistent effort has only been given to it during the past fifteen years. Prior to that time it was a sort of hit or miss, go-as-you-please experiment which was carried on. Even to-day only a few engineers, or so-called experts, appreciate the complex factors that enter into the problem.

To begin with, it must be remembered that except in special cases where mural effects or similar displays are desired, maximum light must be delivered at the working plane. This is usually thirty-two inches from the floor.

Recent engineering studies of office illumination reveal that illuminometer readings, taken at the working plane, do not give data, which if taken alone, will permit the engineer to decide as to the relative merits of illuminating systems. The physiological effect must always be taken into account, and the illuminometer readings used solely as a means for determining the relative distribution of flux between several systems, or the various efficiencies of different types of equipment of the same system.

Results Obtained.

These fundamentals become clearly evident when it is observed through actual experience that in some cases the seeing facilities afforded by one system may be greater than those afforded by a second system, although the amount of flux on the working plane may be less in the first than in the second system.

It has been found that the systems which give the eye the least fatigue are not always the best under general conditions with the various kinds of taste to be suited, for dealing with the human element forces us to cope with the acquired habits formed over a long period of time, which cannot be brushed aside in one moment and must be respected in a partial degree.

The system which may be considered the easiest on the eye is that which gives the least glare. The system which accomplishes this end the best, is known as the total indirect system, in which all of the source of light is completely concealed from the direct vision, and all of the light reflected from large matt surfaces, such as ceilings and walls. This system, however, has the disadvantage of being rather extravagant in comparison with other systems in the amount of current consumed for a sufficient quantity of flux obtained at the working plane for ordinary conditions. It further has the disadvantage of the almost total elimination of shadows caused by its extreme distribution. In office lighting this is particularly inconvenient, as it makes

it difficult to distinctly see sheets of paper lying one above the other. The edges of the sheets lack definition and are not clearly seen.

Lastly, it departs so widely from that to which we have been accustomed for years in the matter of distribution that we find it difficult to throw off the habit already mentioned and accustom ourselves to the weird effect due to the very even distribution of the total indirect system.

Direct Illumination.

The direct system of lighting, such as we have been accustomed to for years, is well known and one to which I may refer only as a step in the art of illumination. The object of direct illumination was primarily one of economy in current consumption, which economy was very essential in the early days of electric lighting, because of the high cost of the production of electricity and the large amount of current consumed by electric lamps for a required amount of light.

The natural outcome of these conditions was the development of small units and the arrangement of the small units made so as to give individual distribution. That is to say, to place a lamp under a shade at each place where a light is required. This method made it necessary to place the lamp immediately in front of, and slightly above the head of the user. The rays from these individual lamps fall directly upon the work in front of the user at an angle which reflects the light directly back from the working surface, resulting in an unnecessary eye strain. The eye being constructed in a manner to be able to protect itself against abnormal light, is provided with a device known as the iris. Under the condition named, the iris contracts so as to reduce the amount of reflected light which reaches the retina, in consequence of which the eye will not see as clearly the work it is intended to see, as it would if a lesser amount of light were used, but so placed that the angle of reflection would not reach the eye.

For the foregoing reasons it is desirable where individual lights are used, that they should be placed back of and above the left shoulder of the user, rather than in front of him. This practice, however, is not always practicable for obvious reasons.

From the principle of direct illumination we find the direct system expanded into semi-individual and from thence into general illumination, and in some instances a combination of individual and general illumination.

All of these various methods, which make use of many different types of shades or reflectors, show the struggle of the illuminating engineer in trying to create an ideal working condition. These efforts, as we now view them, have been futile and we find ourselves leaning between two extremes, that is, a system which lays between the direct and the indirect system. This is known as the indirect system. The advantages of the semi-indirect system may be outlined as follows:

Principal Advantages.

First—It gives to quite an important extent the general distribution afforded by the indirect system.

Second—It gives some advantages of the direct system by reason of a certain percentage, varying with the type of reflector and permitting of moderate shadows.

Third—When the system is well designed, the direct rays are distributed in a way to afford a minimum of intrinsic brilliancy at the point of illumination, thus permitting the eye to remain in its normal seeing condition by not causing the iris to contract and reducing the seeing ability.

Fourth—It permits of the use of large units, which makes the installation and lamp renewal costs low.

The efficiency of a semi-indirect system is greater than the direct, where seeing qualities are to be considered. Fixture manufacturers and illuminating engineers are beginning to recognize the great advantages of semi-indirect over other systems, and the general public is taking very kindly to it. Competition is extremely keen in the design of the fixtures, each manufacturer setting forth his best efforts to design a fixture showing advantages over his competitor.

There are many excellent semi-indirect fixtures on the market to-day, but great care must be used in the selection thereof, as frequently two fixtures which may appear identical with each other have widely different efficiencies, on account of the chemical difference in the make up of the glass.—(Paper read at a meeting of the New York Building Managers' Association by A. O. Wallis.)

THE IMPORTANCE OF PUBLICITY FOR THE ENGINEER.

Why should we engineers be interested in publicity? Is there good reasons for departing from the time-honored precept that our achievements are sufficient witnesses to their creator's ability?

The country is burdened with wastefulness where engineering skill might save vast sums. For instance, it is planned to spend a hundred million dollars on highways in New York State without adequate provision for maintenance. It is hardly possible that such a proposition would have been seriously entertained if the public had waited for the opinion of the engineering profession before making a decision. Again: Recently a proposition to spend fifty million dollars on good roads in Ohio was voted upon without any preliminary studies or surveys as to how the money was to be spent. Had the proposition been approved, the money would have been largely wasted under the direction of jockeying politicians.

There is a vast national field for furnishing engineering information to the public, which can be taken care of only by a permanent national information bureau conducted by engineers.

We have technical and research societies

without number—so many that the public can hardly be blamed for believing that we are interested in material things only. Perhaps we need a national bureau to conduct and cultivate business relations with the public, including inter-society relations, publicity, employment, and legislation.

All over the country there is a growing protest against the direction of municipal affairs by the lawyer and the politician. The administration of municipal business is largely a function of engineering. Why not enable the public to see this situation in its true light and thereby perform a public benefaction, as well as advance our own interests? Positions for engineers would increase in number, and compensation likewise.—C. E. Drayer, before the Engineering Section of the Chicago Association of Commerce.

UNIVERSITY LABORATORIES MAY ASSIST BUSINESS.

An effort to get the universities of the country to handle specific problems for the industries by experiments or otherwise, is being made by the Chamber of Commerce of the United States. At a recent meeting of the directors it was voted to refer the matter of co-operation between the universities and representative business establishments to the chamber's committee on education or to a special committee, and it was further ordered that the subject be taken up with the educational institutions for the purpose of ascertaining the extent to which these institutions may be interested.

At present large industries such as glass making, food, steel and drug manufacturing are connected by very slight threads with the great universities or with the government, except as the government exercises police supervision over the products of the business industries.

In addition to the plan for having the universities make particular investigations, it is suggested that the universities might be induced to organize a course of study, training the students along particular lines that would be of direct benefit to the industries. The understanding would be, in this case, that these manufacturers would be willing eventually to take the most desirable of these students into their plants for the working out of the future scientific development and the problems of manufacture.

The business man who grudges a commission to an advertising agent who thinks "he can do it himself" is usually about as intelligent as he would be if he grudged the commission of the architect and decided to build his store for himself.

He would save the commission of the architect, but ruin the store.

This is the age in which one man DOES ONE THING. You can run your BUSINESS. Find a man who can RUN YOUR ADVERTISING.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

****JOHN STOKES COPE**, a landscape architect prominent in Philadelphia, Pa., died of heart disease at his home in Germantown, Pa., Friday, December 17. He was born in Germantown fifty-eight years ago.

****AARON E. ALDRICH**, vice-president of the Greater New York Brick Co., 103 Park avenue, is ill at his home near Fishkill, N. Y.

****PHILIP M. BEECHER**, vice-president of the Pierce, Butler & Pierce Manufacturing Corporation, Syracuse, N. Y., has resigned to accept the position of vice-president of the Richmond Radiator Co., and will be in charge of sales, with offices at the company's New York City office at 1480 Broadway. Mr. Beecher has been connected with the Pierce, Butler & Pierce Corporation for thirty-six years.

****NATIONAL BUILDERS' SUPPLY ASSOCIATION** will hold its annual convention at Cleveland, O., February 17-19, 1916. Headquarters at the Hotel Statler.

****NATIONAL CONFERENCE on Concrete Road Building** will be held at Chicago, Ill., February 15-18, 1916. J. P. Beck, 208 South La Salle street, Chicago, secretary of the Advisory Committee.

****AMERICAN ABRASIVE METALS CO.**, 50 Church street, New York, has elected Ralph S. Edmonson to succeed A. D. Morris as the vice-president of the firm. He will also act in the capacity of foundry superintendent.

****GEORGE N. STEINMETZ**, a retired contracting engineer, died of Bright's disease at his home, 465 West End avenue, New York, Sunday, December 19. He was born in Seagertown, Pa., fifty-five years ago, and was in the contracting business all his life. Mr. Steinmetz was the contractor for the building of the Galveston, Texas, sea-wall and for the Roosevelt Dam, in Arizona. He retired three years ago.

****ASSOCIATION OF THE ALUMNI** of the American Academy in Rome held its annual meeting and dinner at the Salmagundi Club, Monday evening, December 6, at which the following officers were elected for the ensuing year: Frank P. Fairbanks, president; Charles Keck, first vice-president; Lucien E. Smith, second vice-president, and F. Livingston Pell, secretary-treasurer. Members of the council elected included Lionel Moses, George W. Breck, Paul Manship and Herman A. MacNeil. Mr. Moses, as chairman of the committee on scholarships, told of the association's efforts to raise a \$25,000 endowment fund to found a McKim fellowship in architecture at the academy, in memory of

the late Charles F. McKim. The following trustees of the academy were guests at the dinner: Edwin H. Blashfield, Daniel C. French, William A. Boring, Herbert Adams, C. Grant La Farge, William M. Kendall, Edward K. Rand, Dr. John B. Pine, Charles D. Norton and Dean Andrew F. West. William Rutherford Mead, president of the academy, and Jesse Benedict Carter, the director, also were present.

****HENRY OLMSTEAD**, an architect, died of general debility, at his home, 319 Macon street, Brooklyn, Sunday, December 5. He was born in Philadelphia, Pa., seventy-two years ago, and for some time was the architect for the Lehigh Valley Railroad. During recent years he had been practicing his profession in Brooklyn and designed a number of apartment houses in the Stuyvesant section of that borough. He is survived by his widow, two sons and a daughter.

****SAFETY ARMORITE CONDUIT CO.**, Pittsburgh, Pa., has established a district office at 30 Church street, New York City, in charge of William G. Campbell.

****NATIONAL ASSOCIATION OF BUILDERS' EXCHANGES** will hold its annual convention at the Hotel Emerson, Baltimore, Md., February 22-24, 1916. Secretary, J. M. Vollmer, Louisville, Ky.

****NINTH ANNUAL CEMENT SHOW** of Chicago will be held in the Coliseum and the First Infantry Armory, February 12-19, 1916. Every effort is being made by the management to make the 1916 show thoroughly representative of the cement interests, both to the general public and to the users of cement products.

****JAMES MAPES DODGE**, president of the Link Belt Co., died of pleurisy and pneumonia at his home in Germantown, Pa., Sunday, December 5. He was sixty-three years of age. Mr. Dodge had recently returned from an extended trip through the West and caught cold several weeks ago while at the Panama-Pacific Exposition. He was vice-president of the Franklin Institute and was a member of the Union League, Corinthian Yacht and Germantown Cricket Club of Philadelphia, and of the Engineers' Club of New York. In 1903 Mr. Dodge was president of the American Society of Mechanical Engineers. He was widely known as a mechanical engineer and was foremost in the development of conveying machinery.

****AMERICAN SOCIETY OF CIVIL ENGINEERS** at its annual meeting, to be held January 19, 1916, will vote for the following

officers: For president, Dr. Elmer L. Corthell, consulting engineer, 149 Broadway, Manhattan; for vice-presidents, Palmer C. Ricketts, Troy, N. Y., and Alfred Craven, New York, and for treasurer, Lincoln Bush, New York. Six directors will be elected at the same meeting.

****CORNELL SOCIETY OF CIVIL ENGINEERS**, at its recent annual meeting, elected the following officers: John C. Wait, president; Joseph C. Hilton, vice-president; Charles E. Curtis, second vice-president; William M. Aitchison, recording secretary; and corresponding secretary and treasurer, Ernest T. Truran. The society now has an enrollment of 815 members.

****BUILDING MATERIAL MEN'S CLUB** of Newark, N. J., at its recent meeting elected the following officers: A. Fred Bailey, president; I. Newton Rudgers, vice-president, and W. F. Hopping, secretary and treasurer. This organization is planning to take an active part in the celebration now being arranged for to mark the 250th anniversary of the founding of the City of Newark, which will occur in 1916.

****ARCHITECTURAL LEAGUE OF NEW YORK** will hold its thirty-first annual exhibition in the Fine Arts Building, 215 West Fifty-seventh street, from Sunday, February 6, to Saturday, February 26, 1916, inclusive. The annual dinner of the league will be held Friday evening, February 4, at 7 o'clock. On Saturday, February 5, the league will hold a reception from 3 to 6 P. M. Public lectures will be given on Saturdays, February 12, 19 and 26.

HARDWARE OUTLOOK BRIGHT.

An optimistic outlook is expressed by T. James Fernley, secretary-treasurer of the National Hardware Association, who said:

"Basing my opinion on information which reaches me from houses in various lines of business, both manufacturing and distributing, throughout the country, I feel that the year upon which we are entering will be one of unusual prosperity.

"Business during the past three months has been so satisfactory that a year which looked disastrous from a standpoint of net returns for capital employed is closing with a degree of prosperity which, with many houses, will show dividend paying results.

"So much depends, however, on what may happen among the warring nations that conservatism should be observed and no commercial commitments made which will be embarrassing if the war should come to a sudden termination. Such a reaction would be but temporary, as the basic conditions in this country are so sound that under normal circumstances we are justified in looking for an extended period of prosperity."

Small ideas, small methods, small men are becoming antiquated. This is the day of the broad outlook and big doings.

No More Ashes To Lug

No clumsy pan to spill dust and dirt on the kitchen floor

The Glenwood Ash Chute

solves the problem. It is located just beneath the grate and connected by a sheet iron pipe straight down through the kitchen floor to ash barrel in cellar. No part is in sight. Not a particle of dust can escape. Just slide the damper once each day and drop the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new Glenwood Idea and is very ingenious. This is only one of the splendid improvements of the new plain

Cabinet Glenwood

the Range without ornamentation or fancy nickel, "The Mission Style" Glenwood. Every essential refined and improved upon. This Range can be had with the latest and most improved Elevated or End Gas Range attachments. It can be furnished with fire box at either right or left of oven as ordered. Our handsome booklet tells all about it.

EXPANDED METAL PLASTERING LATH

Actual Size of "Kno-Burn" Mesh

This is the original small diamond-shaped mesh expanded metal lath.

The small mesh requires less plaster to form a perfect "key" than a lath having a larger mesh.

The shape of the mesh is such that the plaster flows around the strands completely imbedding them.

"Kno-Burn" can be quickly and easily shaped to fit any curve or angle without special tools.

We carry complete line of all gauges.

"Evans" Almetl Fire Doors (and Shutters)

FULLY APPROVED BY THE UNDERWRITERS' LABORATORIES, INC.

To Architects, Builders and Contractors:

The "EVANS" ALMETL Fire Door is offered as a marked improvement on the standard tin-clad door now in general use. In its tests at the UNDERWRITERS' LABORATORIES by the National Board of Fire Underwriters, it demonstrated its superiority in many respects.

The tin-clad wooden door has served thus far as the only door obtainable in its class, but its limitations have been recognized. Lacking in durability at its best, it is bound to give place to a light-weight, indestructible, all-steel door such as we now offer.

The "EVANS" ALMETL Fire Door is erected by experienced metal contractors everywhere. Write to us direct for detailed information.

ASPHALT SHINGLES

FRANK C. GILLINGHAM & SON COMPANY

PHILADELPHIA

BUILDING LUMBER

41,500 square feet of Barrett Specification Roofs on N. Y., N. H. & H. R. R. Pier 37, East River, N. Y. C. General Contractors: Snares & Triest Co., N. Y. C. Roofers: Wm. R. Young, Jr., Inc., Brooklyn.

Under Waterfront Exposure—

TUGS and steamships come alongside and vomit hot coal smoke and sparks over this roof. Wind and storm get a full sweep. But the roof is a Barrett Specification Roof—the one kind that is not hurt by such exposure.

That is why The Barrett Specification type of roof covers pier after pier as far as the eye can see up the busy East River waterfront from the great bridges overhead. It is the standard roof for such hard service. Leading con-

struction engineers specify it almost as a matter of course. The Barrett Specification in your building plan furnishes a fair basis for competitive bids. It insures the best materials being used. It specifies the most approved method of construction.

The net result is that Barrett Specification Roofs last twenty years or more without leaks or repairs or maintenance expense. They cost less to build than any other permanent roof. They take the base rate of insurance and are approved by the Underwriters' Laboratories. Copy of The Barrett Specification with roofing diagrams, free on request.

Hydronon

The Damp-proofing Paint

Reduce building expenses by coating the inner surfaces of all walls above the ground level with Hydronon and apply the plaster directly on the wall without lath and air space. The Hydronon excludes dampness and gives a dry base for the plaster.

Hydronon is very dense and penetrates into the wall forming a tight seal. It has superior covering capacity and is vastly superior to other damp-proofing paints in its permanent resistance to dampness. Its superiority has been demonstrated by a series of scientific tests which are described in a booklet which will be mailed free on request.

Velvex Creosote

Shingle Stains

Every desirable color in soft velvety shades. Can be used on unplanned wood of any kind.

The creosote makes them highly preservative and non-inflammable. Booklet free on request.

FOR ATTRACTIVE SCAFFOLDING AND FOOT BRIDGES

An Interesting Competition Designed to Give a Touch of Architectural Beauty to the Temporary Scaffolding and Footways Fronting Structures in Course of Building.

The following notice sent out to architects by George & Borst, contractors and builders, 277 South Eleventh street, Philadelphia, is self-explanatory:

"A desire to eliminate ugly scaffolds from building operations in cities, prompts the firm of George & Borst to offer in competition three prizes for the best designed practical builder's scaffold. The Art Jury of Philadelphia has appointed as judges in this competition Messrs. Horace Wells Sellers, John Hall Ran-

and Georgia, by Edward A. Crane and E. E. Soderholtz.

Full particulars are enclosed.

GEORGE & BORST,
Contractors and Builders,
277 South Eleventh Street, Phila., Pa."

A letter addressed by George & Borst to the "Boston Transcript" and the "Washington Times," replying to a communication from these excellent newspapers asking data regarding the proposed competition, goes into

kin and Arthur I. Meigs. In the hope that this will be one step nearer a realization of the City Beautiful, the successful designs will become the common property of any architect, owner or builder desirous of using them. You are cordially invited to enter this competition and to submit one or more designs. The following prizes will be awarded:

The Work of McKim, Mead & White, 8 volumes.

The Work of Charles A. Platt.

Colonial Architecture in South Carolina

some detail regarding the conditions which prompted the firm's interest in the subject.

The letter follows:

"January 4, 1916.

'The Boston Transcript,'

Boston, Massachusetts.

Gentlemen:

I wish to acknowledge your letter of December 31st, 1915, and without further words will explain the nature of our competition.

A few years ago it occurred to us that builders' scaffolds, or footwalk bridges as

they are sometimes called, were most objectionable from an aesthetic point of view, so we set about to improve upon the design. After much thought we devised a neat structure, painted the boards white with cold water paint, and ornamented the framework with lattice work and trailing vines. At this time we had four buildings in course of construction in the heart of the business section of Philadelphia, and one night we converted the old hideous unpainted, unadorned scaffolds into attractive shelters. The effect was electrical; the success instantaneous. Congratulations poured in from all sources; crowds gathered the next morning to view this unique experiment; photographs or news items appeared in at least twenty-four publications; and in the Philadelphia 'Public Ledger' alone photos or references were made in seven different issues, a whole page being devoted to views in its Sunday Pictorial Supplement. We quote one typical letter from Morris L. Cooke, Esq., then Director of Public Works of Philadelphia:

'My attention has been called to the very artistic footwalk bridge you have erected in connection with the reconstruction of Huyler's store at 1320 Chestnut street. I want to express my very sincere appreciation of the splendid manner in which you have carried out one of the department's ideas in the matter of co-operation to make Philadelphia a beautiful city, even in the midst of reconstruction work.

This bridge has been commented on in a highly flattering manner by many callers at this office, and I want to assure you that your work in this connection should act as an inspiration to everyone in your line of business.

Again thanking you, I am,

Yours very sincerely,

(Signed) M. L. COOKE,
Director.'

Suffice for history. While we have tried to show its success, it is necessary to say that criticisms were heard now and then, but these were always directed against the design—not the idea of ornamentation. Some objected to the vines, others to the lattice, while still others suggested the use of flower boxes, etc., etc.

With the object of securing really beautiful designs at a minimum cost, we are inviting three hundred (300) of the best known architects in Boston, New York, Philadelphia, Baltimore and Washington to enter a competition for this purpose, and are offering as prizes the best architectural books published. The Art Jury of Philadelphia has appointed three of Philadelphia's most representative architects as judges, and a fair competition is assured. The chairman of this competition is the President of the Philadelphia Chapter of the American Institute of Architects. When the designs are selected they are to become the property of any who cares to use them, for no charge whatever will be made for their use. It is hoped that this plan will

(Continued on page 53.)

AMERICAN INSTITUTE OF ARCHITECTS (Organized 1857)

OFFICERS FOR 1916.

President.....J. Lawrence Mauran, St. Louis
First Vice-President.....C. Grant LaFarge, New York
Second Vice-President.....B. Medary, Jr., Philadelphia
Secretary.....Burt L. Fenner, New York
Treasurer.....D. Everett Wald, New York

Board of Directors 1916

For One Year—Walter Cook, New York City;
W. R. B. Wilcox, Seattle, Wash.; Octavius Morgan,
Los Angeles, Cal.

For Two Years—Charles A. Savrot, New Orleans,
La.; Elmer C. Jensen, Chicago; Charles C. Cool-
ridge, Boston.

For Three Years—Edwin H. Brown, Minneap-
olis; Benjamin J. Lubsch, Kansas City; Horace
Wells Sellers, Philadelphia.

PHILADELPHIA CHAPTER A. I. OF A.

President.....Horace Wells Sellers
First Vice-President.....J. P. B. Sinkler
Second Vice-President.....Milton B. Medary, Jr.
Secretary.....Edward A. Crane
Recorder.....Arthur I. Meigs
Treasurer.....Edmund S. Evans
Executive Committee—Elliston P. Bissell,
Charles Z. Klauder, Walter H. Thomas.

T SQUARE CLUB.

President.....John F. Harbeson
Vice-President.....Herman L. Duhring
Secretary.....Wilbur H. Tusler
Treasurer.....Walter Mellor
Directors—E. Nelson Edwards, William F. B.
Koelle, Clarence C. Zantzing,er,

Editorial Comment

This number of "The Guide," in addition to the features identified with the Annual Building Statistics Number, familiar to its readers, presents a number of features, more or less new to its pages in deference to the fact that this is "The Structural Iron and Steel Builders' Hardware and Allied Industries Number."

The inception of this special number had its suggestion in the extraordinary activity in iron, steel and related industries incident to the demands of the warring nations abroad. Insensibly in a measure, the prosperous conditions obtaining in the fields mentioned have been communicated to interdependent and related lines, with the result that a condition of unusual activity is more or less general.

The fact that in many of the industries affected the war orders are of a size demanding full time for years beyond the estimated life of the present European conflict, should dissipate all fear of a slump to panicky conditions following a sudden peace. The outlook is in every sense hopeful and encouraging that 1916 will break all records. Building activity has reached a point indicating conditions of prosperity practically national in scope and influence. The outlook for the new year is one of healthy and optimistic tendency.

In nearly every line of the building trades the future looms bright, promising and hopeful of big things. Here, then, is a toast to 1916: May it flower into a year of new records of prosperity and material achievement.

And may "The Guide's" readers, its friends and its advertisers share largely and profitably in the melons to be cut during the booming, brilliant twelve months ahead!

May 1916, indeed, prove a bright and happy New Year to all and each of us!

* * *

In spite of a bad start, building for the year 1915 in Philadelphia exceeded the total for 1914 by more than \$4,000,000 and more than 2,000 operations; the totals for each period mentioned being 17,772 operations, to cost \$39,444,125 last year, compared with 15,709 operations, costing \$35,419,605 in 1914.

As a matter of fact, last year's total was exceeded only three times since 1905, these occasions being 1906, when 17,872 operations, cost \$40,711,510; 1909, when 17,294 operations, cost \$42,881,370, and 1911, when operations numbered 16,215 and cost \$40,030,985.

Of last year's total expenditures for building work, amounting to \$39,444,125, \$21,815,725, considerably more than half, represents the cost of 9,447 dwellings. Compared with 1914, when 6,921 houses were built, at a cost of \$15,531,495, this shows an increase of 2,576 operations and \$6,284,230.

Of last year's houses, 8,810, to cost, \$22,387,800, were of the popular two-story class,

which has given Philadelphia its sobriquet, "The City of Homes;" 623 were three-story, costing \$3,237,425; eleven four-story, costing \$52,000; forty-three of frame, costing \$12,400, and ten of one-story, costing \$16,100. In 1914, 6,418 two-story houses, cost \$12,997,300; 475 of three stories, \$2,412,345; two of four-stories, \$56,000; twenty-four of frame, \$59,350, and two of one-story, \$6,500.

Generally improved business conditions are indicated by the construction of seventy-seven new manufactories last year, at a cost of \$2,973,485, compared with sixty-four, costing \$2,078,485, in 1914, and thirty-four warehouses, to cost \$600,060, as against twenty-two, costing \$316,850, in 1914.

* * *

Some of the principal buildings erected last year are a ten-story loft, on the site of the old Cyclorama, northeast corner of Ninth and Sansom streets, for S. P. Wetherill and others, to cost \$500,000, and a four-story loft, 395 by 240 feet, at the northwest corner of Twenty-third and Market streets, for Kahn & Greenberg, to cost \$400,000.

Beside these there were:

Six-story factory, 210 S. 13th St.....	\$45,000
Two-story factory, 109-11 N. Oriana St.	8,300
Eight-story factory, N. E. Cor. 11th and Brandywine	150,000
Four-story factory, 913 Arch St.....	25,000
Five and six-story addition, Locust, west of 22nd.....	90,000
Two-story garage, N. W. cor. 21st and Brandywine	18,000
Eight-story factory, 253-5 N. Broad....	95,000
Two-story warehouse, N. E. cor. Kensington Ave. and Hilton St.....	11,000
Eight-story warehouse addition, Pine, above Delaware Ave.....	60,000
Eight-story factory, 831-5 Cherry St.....	100,000
Two-story warehouse, east side Front, opposite Federal St.....	63,000
Four-story factory, S. E. cor. 20th St. and Erie Ave.	70,000
Seven-story warehouse, 4142-56 Germantown Ave.	100,000
Four-story factory, N. E. cor. Pechin St. and Krams Ave.....	100,000
Six-story factory, S. E. cor. 11th and Race Sts.	110,000
Seven-story factory, 315-18 Arch St.....	100,000
Six-story factory, N. W. cor. 4th and Cherry Sts.	45,000
Addition to grain elevator, Schuykill Ave., west of 26th St.....	200,000
Five-story addition, S. E. cor. Westmoreland and Mascher Sts.....	120,000
Remodeling City Club, 313-17 South Broad St.	66,000
Three-story addition, S. E. cor. Clementine and Thompson Sts.	18,000

Four-story garage, N. W. cor. 9th and
Cumberland Sts. 50,000
Three-story factory, 1617-23 Melon St. 18,500
Five-story store, 917 Arch St. 15,000

The foregoing are included among fifty-four first-class, commonly known as fireproof, buildings, erected in this city last year at a cost of \$6,714,290. Beside these, twenty-nine additions of first-class construction to existing buildings were constructed at a cost of \$1,512,600.

* * *

The year's work in detail follows:

Character.	Permits.	Operations.
Dwellings, 1-story.....	9	10
Dwellings, 2-story.....	1,406	8,810
Dwellings, 3-story.....	272	623
Dwellings, 4-story.....	2	11
Dwellings, frame	36	43
Tenement houses	6	9
Apartment houses	1	1
Stables	77	78
Manufactories	74	77
Workshops	65	65
Garages	581	595
Office buildings	39	39
Stores	50	74
Warehouses	34	34
Engine and boiler houses...	9	9
Churches	16	16
Schools	13	13
Halls	3	3
Municipal buildings	5	5
Hotels	2	2
Hospitals	4	4
Charitable institutions	1	1
Power houses	5	5
Club houses	4	4
Bank buildings	1	1
Parish buildings	1	1
Library	1	1
Places of amusement.....	3	3
Miscellaneous buildings	134	137
Additions	1,576	1,655
Alterations and repairs....	2,796	2,983
Miscellaneous work	1,825	1,952
Heaters	297	326
Fire-escapes	62	62
Signs	114	114
Rooming house	1	1
Armory	1	1
Convents	2	2
Bath houses	2	2
Totals	9529	17,772

* * *

The number of building operations in each ward is shown in the following table:

Ward.	Permits.	Operations.
First	228	241
Second	167	174
Third	81	83
Fourth	87	91
Fifth	162	166
Sixth	133	129
Seventh	141	147
Eighth	206	207
Ninth	193	195
Tenth	157	157
Eleventh	49	48

Twelfth	55	57
Thirteenth	88	96
Fourteenth	105	111
Fifteenth	176	176
Sixteenth	37	37
Seventeenth	59	60
Eighteenth	72	82
Nineteenth	204	210
Twentieth	183	187
Twenty-first	260	348
Twenty-second	616	859
Twenty-third	351	521
Twenty-fourth	252	279
Twenty-fifth	219	465
Twenty-sixth	215	308
Twenty-seventh	180	205
Twenty-eighth	164	179
Twenty-ninth	105	147
Thirtieth	85	86
Thirty-first	115	148
Thirty-second	132	146
Thirty-third	344	944
Thirty-fourth	427	1,002
Thirty-fifth	177	229
Thirty-sixth	127	132
Thirty-seventh	84	85
Thirty-eighth	301	437
Thirty-ninth	437	1,839
Fortieth	336	1,354
Forty-first	192	268
Forty-second	633	2,022
Forty-third	217	530
Forty-fourth	157	190
Forty-fifth	252	802
Forty-sixth	352	1,179
Forty-seventh	128	138
Forty-eighth	88	267
Totals	9,529	17,772

As is indicated in the foregoing table, the greatest activity was in the wards in which the operative builders were busiest. With the exception of the Eighth, in which several large structures, such as the new Franklin Bank, on Chestnut, west of Broad, are under construction, and the Ninth, where a great many important improvements are under way, expenditures for building fail to reach a million dollars in any except the dwelling wards.

The Forty-second Ward, in which Logan is located, leads with 2,022 operations, costing \$4,935,085. The Thirty-ninth follows, with 1,839 operations, costing \$3,502,205, and then comes the Fortieth, 1,354, to cost \$3,192,235; the Forty-sixth, with 1,179, to cost, \$3,444,500; the Eighth, 207, to cost \$2,572,285; the Thirty-fourth, 1,002, to cost \$2,264,885; the Twenty-second, 859, to cost \$2,089,500; the Thirty-third, 944, to cost \$1,980,205; the Twenty-third, 521, to cost \$1,542,275; the Forty-fifth, 802, to cost \$1,270,645; the Ninth, 195, to cost \$1,140,405, and the Thirty-eighth, 437, to cost \$1,075,350.

* * *

While building was very active, particularly among the operative builders, the latter part of last year, the outlook, according to leading general contractors, is considerably better for next year than has been the case for some years past.

FOR ATTRACTIVE SCAFFOLDING AND FOOT BRIDGES.

(Continued from page 51.)

be widely adopted, for though the project has hardly been launched it has already met with widespread enthusiasm.

It is interesting to note the development of scaffolds since the advent of our original shelters. Hardly a builder has erected a building in this city but that he has at least painted the footbridge, and in some cases pleasing innovations have been made. The plan has even extended to other cities, though no attempt was made heretofore to pass the idea along.

An exhibition of all designs submitted will be held in one of the architectural clubs of Philadelphia and photographs of the three successful designs are to be printed in the Philadelphia 'Public Ledger.' We also suggest your doing the same. The competition will not be closed until March 1st, and the moment the judges make their selection we will release the designs to the public. We feel that this competition will mark the passing of a time-honored but in no wise regrettable institution. No builder can offer an objection on the ground of extravagance, for in the four cases previously mentioned it cost us but an average of \$16.00 a scaffold more than the roughest shelter required by law; and surely the reputation of any builder is worth that much.

An invitation is being mailed you under separate cover, as is also a photograph of one of our first attempts at beautification. We feel that Boston and Washington will welcome this plan with the same enthusiasm that Philadelphia has shown, and we hope eventually to spread these designs broadcast over every part of the country.

STUDY THE ADVERTISING PAGES.

The average reader does not pay very close attention to the advertising pages unless he happens to be particularly interested in some product or is in the market for equipment or material. He is missing a part of scientific literature which offers suggestions as practical as the reading pages. He is also losing an opportunity of studying a subject which bears the most important relationship to every business on earth. No matter what line of work you may be engaged in, a knowledge of publicity and salesmanship is valuable. Every form of occupation to be made successful depends upon a degree of salesmanship. Study the advertising pages. They represent an expenditure of time, thought and money, which makes them well worthy of your attention.—'Municipal Engineering.'

Don't try to see out of some other man's eyes when you've got a pair of your own,—use them and go over every job carefully before you consider that you are through with it, and don't forget that one "good job" is a better advertisement than many poor ones.—Exchange.

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

SOLID WIRE GLASS.

The Pennsylvania Wire Glass Company's Product Manufactured by a Special Process.

From the laboratory experiment—the novelty—of two score years ago, wire glass has come to occupy an unique and rapidly growing place in the world of building material. It serves a need not served by any other product. Usually structural elements may be fashioned in several ways, but the fire resistant window and the skylight that does not disintegrate when cracked must be of wire glass—nothing else will serve. The "Safety First" movement has worked greatly to the benefit of wire glass, and the reverse may be said with equal truth. As a consequence wire glass now finds employment in every building of importance. It has become as standard as brick or steel or concrete. In office buildings, factories, mills, railway shops and terminals, schools—in all the myriad of places where light is demanded and fire and breakage done away with, wire glass finds its employment.

As is inevitable, many minds have worked on the problem of wire glass manufacture and brought forth results of varying degrees of efficiency. In common with other building materials, solidity and homogeneity of structure make for service, and the Solid Wire Glass, made by the Continuous Process, is pre-eminent in this regard. It is made by the Pennsylvania Wire Glass Company, whose headquarters are in Philadelphia, and it has been used in the most important manufacturing and railroad projects in this country and Canada.

STEEL OUTPUT FOR 1915 NEAR RECORD

The 1915 steel story was phenomenal. So close was the output to that of 1913, which was the maximum production year in the history of the country, that it will require full official returns to make the exact facts known. The indication is, however, that the output of both ingots and rolled steel products in 1915 was record breaking. The output of ingots was 31,500,000 tons; in 1913 it was officially reported, 31,300,874 tons were produced. Upon this basis approximately 25,000,000 tons of semi and fully finished products were rolled, exceeding the 1913 production by over 200,000 tons. Comparisons with 1914, year of the greatest depression, show a recovery which three months ago would have been considered impossible.

The steel mills were keenly disappointed in the orders for railroad equipment placed during the first eight months of the year, and most of the large railway equipment manufacturers turned with avidity to war contracts to keep their plants in operation. The improvement that came in the second quarter was largely due to export contracts for cars and locomotives. During the last quarter of the year, however, especially in October and November, the railroads placed relatively large orders for cars and motive power. Contracts for cars, including the orders placed with railroad shops, as well as with merchant builders, and for export as well as for domestic shipment, aggregated 142,436, which was an increase of 65 per cent. over the contracts placed in 1914. During the latter year there had been a drop of 40 per cent. in car orders compared with 1913.

Locomotive builders secured contracts from abroad in large measure before the 1st of July. Since that time domestic roads have been more generous in placing contracts. Including the orders placed for building at railroad shops the contracts booked during the year aggregated 2,044 engines, being an increase of 58 per cent. over the orders secured during the preceding year. In 1914, compared with 1913, there had been a decrease of 55 per cent. in the buying of motive power. Several important contracts are now under negotiation and there is reason to expect decided improvement in the buying of locomotives in the next few months.

The rail mills show an increase of 136 per cent. in orders booked during 1915, as compared with the contracts taken in 1914. Total sales were 3,587,000 tons, of which about 1,600,000 tons are for delivery in 1916. The largest contracts ever taken by the rail mills, however, were in 1913, when orders for over 4,000,000 tons were booked. The rail mills have a capacity of over 5,000,000 tons a year, but a large part of their capacity was utilized temporarily in 1915 to roll round bars for the manufacture of war munitions.

One of the most brilliant records of the year was established by the fabricating

shops, with sales of 1,441,000 tons, of which 236,000 tons were contributed by the railroads for bridge work. The volume of business was increased 49 per cent., as compared with 1914, and increased 44 per cent., as compared with the 1913 contracts. A large part of the gain was secured by independent fabricators.

While railroad equipment contracts made such a favorable showing during the last few months of the year, the total tonnage of steel required—5,531,760 tons—was scarcely more than 18 per cent. of the total contracts booked by the steel companies. This was a gain, however, of 83.7 per cent. compared with the tonnage required in 1914, but a decrease of 35 per cent. as compared with the tonnage required in 1912. The bridge work placed by the railroads increased 35 per cent. compared with the contracts placed in 1914. In the last week the bridge orders distributed by the railroads call for 11,000 tons, the heaviest weekly orders since October, bringing the total for December to 20,000 tons.

The consumption of pig iron in 1915 increased about 33 per cent. as compared with 1914, and decreased about 2.9 per cent. as compared with the record breaking melting in 1913. The total supply of pig metal available in 1915 was a little over 32,000,000 tons, including stocks, production and imports. A little over 2,000,000 tons was withdrawn from consumption through exports of a little over 200,000 tons and stocks of 1,800,000 tons. Consumption apparently was slightly in excess of production during the year.

Merchant sales of pig iron in 1915 were approximately 7,000,000 tons, being with one exception the largest yearly transactions in the history of the trade. The maximum sales were made in 1912, estimated at 7,465,000 tons. The December, 1915, sales were 600,000 tons.

U. S. STEEL'S EARNINGS FOR 1915 WILL REACH \$129,000,000.

Net earnings of the United States Steel Corporation for the nine months ended September 30 last were slightly more than \$79,000,000. It is expected that the final quarter will show a total of nearly \$50,000,000, so that the net revenue for the 12 months of 1915 is expected to be in the neighborhood of \$129,000,000.

While the showing for the final quarter will be remarkable in many respects, the earnings in 1916 will be even at a larger average rate, as the company will be receiving the benefit of higher price for its products.

During 1915 the company authorized more than \$10,000,000 in extensions and improvements, and some of these will be completed in 1916 and will contribute substantially to the company's earnings.

IRON INDUSTRY HAS SURPLUS OF EARNINGS

The iron industry closed the year 1915 with large surplus earnings. Richer revenues still are promised for the first two quarters of 1916 from the 15,000,000 tons to be delivered at highly remunerative prices. Only nine months ago income was insufficient to meet obligations. To-day treasuries are full.

The year's productive achievements are noteworthy. The theoretical annual capacity of the steel furnaces has been raised to 46,800,000 tons of ingots and the actual performance to-day is at the rate of 40,000,000 tons per year and the output for 1915, notwithstanding the relatively low rate of activity during the first half of the year, was approximately 31,500,000 tons. This is an increase of about 34 per cent. over the output of 1914 and an increase of 63 per cent. over the maximum production in 1913. The indication is that 25,000,000 tons of finished products were rolled, being about 7,130,000 tons more than were rolled in 1914 and 209,000 tons more than in 1913. The pig iron production is estimated at 30,000,000 tons, being 28.5 per cent. greater than in 1914 and 3.1 per cent. less than in 1913.

In respect to the contracts secured, however, 1915 stands pre-eminent. The estimated sales of rolled products exceeded 31,000,000 tons, being 75 per cent. greater than the orders taken in 1914 and 17.6 per cent. larger than in 1912, the year of previous maximum business. The selling of this enormous ton-

nage carried prices upward \$12 to \$20 per ton. In 1914 prices had receded \$2 to \$8 per ton following a drop of \$5 to \$9 per ton in 1913.

An increase of 500 per cent. in ocean freight rates in the last year makes it clearly evident that many more freight carriers are urgently needed. To supply this need 200 ocean-going boats calling for 400,000 tons of steel were ordered during the past year, most of them in the past six months. The capacity of the largest yards is sold for fifteen to eighteen months. Extensions and improvements are now being made by the ship builders that will permit the construction of many more boats in American yards.

Much was expected from the railroad companies after the Interstate Commerce Commission granted the plea for an increase of 5 per cent. in freight rates, but not until October and November were any substantial orders placed for cars and locomotives. The larger orders for rolling stock placed in the second quarter came mainly from foreign buyers. The buying of rails, however, was most satisfactory, the gain over 1914 being over 136 per cent. It will be recalled that railroad equipment orders placed in 1914 were the smallest since 1908. The recovery in 1915 was helped by the large export sales and the building of more equipment at railroad as well as at merchant shops. Compared with 1914 car orders increased 65 per cent. and locomotive buying was increased 58 per cent.

HENRY DISSTON & SONS, INC.

"Good steel and honest work," Henry Disston's own explanation of his success, have brought the enterprise founded by him three-quarters of a century ago to a magnitude probably undreamt of by him in his most optimistic visions of the future. It would have been difficult for him to see, in the crude little shop of 1840, with its home-made furnace and meagre tools, the nucleus of a plan equipped with every refinement of the sawmakers' art, having 58 buildings, covering 50 acres of ground, and employing 3,600 men. "Good steel and honest work"—he had no other assets. A thorough knowledge of sawmaking, a little steel, and a few tools, given him in lieu of salary when his employers failed, were his entire stock in trade. Obscurity, and a strong prejudice against tools of domestic manufacture had to be overcome, but "quality" did it and opened the way to recognition for American manufacturers of tools of every kind. "Good steel and honest work," that was all he needed. Capital would come when he had his market.

With a product superior to any other of his time, Henry Disston soon gained recognition as the leader in his field. From this time on development was rapid—simply keeping pace

with the growing demand. His efforts to improve the quality of his saws were unceasing. To get a steel exactly suited to his needs, he built a plant for melting steel himself in 1854 (the first crucible saw-steel plant in America). Twelve years later a file works followed, to supply the immense quantities of files used in the saw plant. (35,000 dozen a year are now used.) Gradually the manufacture of a wide variety of tools was undertaken.

When Henry Disston died in 1878, his sons succeeded him, and his descendants are to-day at the head of the business. Development has been steady and great, but always with the founder's simple motto of "Good steel and honest work" as a guiding policy in competition with the world. "Three-quarters of a century's reputation for quality is too valuable an asset to be jeopardized by inferior products," is the way the present heads express it. Three generations of Disstons have administered the company's affairs since its establishment. And as a sidelight on the respective attitudes of employers and employed, it is interesting to note that a score of men have been with the company over fifty years, and in several instances three generations of the same family work side by side.

BUFFALO WIRE WORKS CO., INC.

The Buffalo Wire Works Company, Inc., of Buffalo, New York, with Philadelphia offices at 11 South Seventh street, manufacture a line of wire work that covers every requirement of the trade, wire cloth, hexagon netting, all meshes; painted, galvanized and bronze window screen cloth; "Grimm's galvanized corrugated wire lathing," plain wire lathing, bank and office railings, wickets, panels, door grilles, office and bank screens, brass rails, elevator enclosures, elevator cabs, wire signs, tool room enclosures, stall guards, wire lockers, window guards, skylight guards, folding gates, vine trainers, coal screens, sand screens, lawn settees, lawn chairs, tree guards, spark guards, wire fencing and machinery guards are among the many wire specialties fabricated by this widely known concern.

The Buffalo Wire Works Company succeeds the firm Scheeler's Sons, which had its origin way back in the '50's by Mr. Martin Scheeler, Sr. In 1903 incorporation papers were filed under the name of Buffalo Wire Works Company, and the following officers are now in charge: Mr. Martin Scheeler, president; Mr. Ferdinand Grimm, vice-president; Mr. John C. Scheeler, secretary; Mr. Philip M. Scheeler, treasurer; Mr. Charles A. Scheeler, assistant treasurer. The New York office is located at 30 Church street.

The plant is one of the largest and best equipped in this country and extends from 316-326 Terrace and from 61-89 Jackson street, in the city of Buffalo, and all the latest machinery and improvements have been installed to care for the requirements of their customers.

The Philadelphia offices, show rooms and warehouse are under the management of Mr. George L. Silpath and Mr. William S. Silpath, men of years experience in the manufacturing and marketing of wire goods. Messrs. Silpath were formerly associated with the DeWitt Wire Cloth Co. and the Rogers Wire Works.

The new No. 8 E Catalog of this company, which is just off the press, contains references and tables of many kinds valuable to business men. It thoroughly explains and illustrates the many kinds of wire cloth, wire work and ornamental iron work manufactured by the Buffalo Wire Works Company, and will be mailed free upon request.

BETHLEHEM'S INCOME BIG.

Although it is admitted by every one that the Bethlehem Steel Corporation will make a good showing in 1915, the earnings in 1916 will be at least 300 per cent. greater. During the new year the company will be turning out shells at the rate of 10,000,000 per year. Estimates of the earnings on the common stock vary considerably, but that they will amount to several hundred per cent. on the issue is not doubted.

PHILADELPHIA AS A BUILDING CENTER

A Classified and Tabulated Statistical Review of Structural Activities During 1915

Number of New Buildings Erected from January 1st to December 31st, 1915.

ROEBLING WIRE LATH.

The unrivalled advantages possessed by Roebbling Wire Lath over all other plastering foundations comes from the fact that the wires being of inconsiderable bulk, become imbedded in the plastic material when applied, with the result that the plaster forms practically a continuous surface on the back as well as the front. The bulk of the wall is made up of cement or plaster. It thus becomes practically impossible to disengage the cement or plaster in which Roebbling Wire Lath is imbedded.

The lath and plaster are obviously more securely united than by means of the key that is formed where other lath, particularly wood, is employed, and is infinitely more secure than where the plaster is applied to material having a flat surface, and the two are held together only by adhesion.

Roebbling Wire Lath is not combustible, and when properly plastered, the wall will resist the action of the elements and withstand vibration.

The advantage possessed by Roebbling Wire Lath over the several forms of expanded metal is the great contrast in strength of drawn wire, woven into a strong, close-knit fabric, with interwoven stiffening ribs, as against a rolled sheet metal surface, squeezed thin, and weakened at a thousand points from the cutting and expanding process. Expanded metal, when galvanized, is coated before the punch press cuts the openings. The cuts leave raw and exposed edges without protection of galvanizing, for the action of the elements to begin destruction and disintegration. Also the edges of the expanded metal are so sharp as to cause injury to the hands of workmen applying same.

Sheet metal lath, so called, is made from rolled sheet steel, and has openings for the plaster key, either punched or cut through the sheet. The lath is not expanded and the sheet of lath is the same area as the original rolled sheet before the punch press has cut the small openings. The objection to this material comes from the large amount of space on the rolled sheet which has no keystone, or backing whatsoever, and the great amount of metal upon the reverse side that is unprotected by plaster and therefore is liable to corrosion. Also in event of a fire, walls upon which the plaster is applied to sheet metal lath are a constant menace, as when water is applied, causing sudden contraction, the plaster is likely to immediately peel off. In the use of Roebbling Wire Lath all material is disposed of in accordance with scientific principles. The mortar forms a continuous sur-

face at the back, and the wire is completely imbedded.

Other kinds of metal lath are rarely offered as galvanized after being fabricated, the expense of coating being prohibitive. It is, however, often contended that the extra thickness of the iron makes the heavy coating unnecessary. Such, however, is a fallacy, as it will be readily understood that when iron is attacked by rust the extra amount of metal will not materially retard the rapid destruction of the whole mass. Zinc applied by the hot process after fabrication is the factor contributing to complete resistance of corrosion and therefore to durability.

It should also be noted that there is a difference in "galvanizing." The deposit of zinc as applied by some processes is so thin as to add only nominally to the weight and proportionately to the durability. All of Roebbling Galvanized Wire Lath is coated by the hot process, and it is an undisputed fact that this process applies the heaviest deposit.

Plaster board and flat wood lathing (also stamped sheet metal used without plaster for ceilings) are not entitled to serious consideration, as each has only its low cost to recommend its use. Only a thin coating of plaster may be applied, and this in itself is sufficient to deny it consideration, since it does not afford the measure of fire protection to be expected from real plastering. Being very thin it does not deaden sound. As a rule such material is used only in buildings of very low cost, where cheapness is a primary requirement. The fact that mortar cannot pass through it and form a "clinch" or "key" at the back makes it undesirable for buildings of permanent character.

Roebbling Wire Lath partitions are preferable to hollow tiles, as hollow tiles require more floor space, and tile partitions are of excessive weight, requiring proportionately heavier frame work, also when a building settles the joints between tiles sometimes open up.

Roebbling Wire Lath is manufactured by the New Jersey Wire Cloth Company, of Trenton, N. J., who will be glad to furnish descriptive literature to builders, architects and others interested in securing a wire lath that is "the acknowledged standard."

If your proposition is one that should appeal to architects, builders, building owners, decorators, material and supply concerns, "The Builders' Guide" is the right medium for your advertising and cannot fail to bring you profitable returns.

WILLIAM GUERIN

FIRE PROPHET IN NEW ROLE.

Real experts in Fire Prevention are rare, and it is doubtful whether there is in this country, or any other, a man better equipped for that work than Chief William Guerin, formerly head of the Bureau of Fire Prevention of the City of New York, who has been chosen by the Pyrene Manufacturing Company to head its new Engineering Bureau, announcement of which has been just received.

Chief Guerin started in the New York Fire Department as a fireman in 1889, when Hugh Bonner was Chief. He worked his way up the ladder, earning promotion through the successive grades of engineer, lieutenant, captain and Deputy Chief. He missed by a fraction of one percent, appointment as head of the department, but it was reserved for him to do a greater work, in establishing the City Fire Prevention Bureau.

From 1911 to 1913, when he retired, the fire loss of New York City was reduced by many millions of dollars a year as a result of reforms instituted by Chief Guerin. It showed what could be done. At once the idea spread over the country. Portland, Oregon, was one of the most successful cities in establishing bureaus of this kind. Factories were cleaned

up, fire alarm systems overhauled, extinguishers installed and means of egress cleared or enlarged.

A striking example of Chief Guerin's knowledge of fire hazards was shown early in December, when Hopewell, Va., was wiped off the map because it neglected to take the precautions that he advised. In August Chief Guerin was called into consultation by the Business Men's Association of Hopewell. He made an inspection of the "magic city," and then entered his report, urging that inasmuch as there was no water supply the city be equipped with small one-quart fire extinguishers.

"A daily miracle is performed when the sun rises and finds your city intact," he wrote, and he added: "What you have to fear most is fire, for if it once got any great headway, your city's name would be Hopeless."

His warning was ignored and the city was swept away.

THE ABRAM COX STOVE COMPANY

Of the many diversified industries of Philadelphia, perhaps there are none more important than the Abram Cox Stove Company, located at American and Dauphin streets, Philadelphia.

Since 1847 this company has manufactured all that is best in stoves, ranges, furnaces and boilers for every type of home under the name "Novelty."

Philadelphia has been placed by the great strides made by this company, foremost in the world's production of this commodity. To-day this business nears the million dollar mark, and it is felt to be still, as it were, in its infancy.

Optimism has ever been the keynote of the enterprise. To verify this word of so many meanings, all that is needed is a trip through the city factory or the larger plant at Lansdale, Pa. The observer will find either a veritable beehive of industry. Both plants are equipped in the most modern manner for the speedy manufacture of stoves, etc., at a minimum cost.

The two plants cover a total area of 500,000 square feet, inclusive of the warehouses. The

city plant covers one and one-half acres; that at Lansdale, eleven and one-half. The capacity is 100 tons daily of melted iron. Many tons of coal, coke and sand are also used. From the various departments of the factories comes every casting and sheet iron part used in the production of the stoves, heaters and boilers—from original plans to final polish. This intensiveness, they say, insures uniform quantity of materials at the least possible manufacturing cost, and furthermore and what is most acceptable to their patrons, prompt deliveries.

Within the last few years the company has produced the most advanced type of combination coal and gas range, for it has been realized that many persons desire to get away from the strictly coal range. It is also evident that they do not care to take the radical step of using gas exclusively. They feel that they have hit upon a happy and efficient medium in "Yearound" and duplex type range.

The highest type of this range is absolutely complete in every particular, combining as it does all the features of two separate ranges condensed into the space of one. It requires no blacking, having a permanent black finish, a process of their own. Its top is gun metal and is cleaned simply with the use of an oiled cloth. The gas light is placed at the top of the range so that it throws light directly upon it just when it is wanted. The gas water heater at the side completes the equipment.

"In our furnaces we believe we have embodied all that is best and have provided for every demand of warm-air heating. In their construction we have omitted no feature of merit which will add to their efficiency and economy. This has all been obtained only through years of experience as manufacturers."

The company was established in 1847 by Abram Cox, with a factory at Sixth street and Germantown avenue. The firm name was Cox & Boughton. A salesroom was maintained at 58 North Second street. A few years later the firm name changed to Cox, Hagar & Cox, and later to Cox, Whiteman & Cox. In 1882 it was incorporated as the Abram Cox

which was used in the above operations. We are in a position to make prompt shipments, and want your business.

GIANT PORTLAND CEMENT COMPANY

603-610 PENNSYLVANIA BUILDING - PHILADELPHIA, PA.

Stove Company. Shortly after being incorporated the Lansdale factory was built.

The company has had a steady growth since its beginning. Its greatest progress, however, has been made since 1882. In 1885 Abram C. Mott became president and served in that capacity until February 15 last, when he retired from active business and became chairman of the Board of Directors. Following the

retirement of Mr. Mott, Robert A. Patton was elected president.

The present officers of the concern are: Robert A. Patton, president; Abram C. Mott, Jr., first vice-president; Abram C. Mott, second vice-president and chairman Board of Directors; Charles M. Mott, treasurer and secretary, and Charles M. Ambler, assistant treasurer and secretary and sales manager.

for manufacturing cement through an artificial mixture of limestone and clay, and patented his discovery in 1824, started a far-reaching, although until late, slow-moving revolution in engineering and construction work. From England the use of Portland cement spread to Germany, and the first Portland cement used in the United States was imported from Germany.

Now, however, the United States has opening before it a new field for cement in South America, which heretofore derived practically all of its cement from Belgian, German and English sources. Before the war Brazil alone was buying considerably more than five million dollars' worth of cement a year, in which trade the United States shared to the extent of less than three hundred thousand dollars. The Argentine was purchasing hundreds of thousands of barrels abroad, Germany and England contributing from eight to twelve times as much as the United States. But the closing off of the ordinary European sources has resulted in an increasing export trade to the South, and Brazil recently bought nearly a hundred thousand dollars' worth of American cement in one month. In the growth of the industry, whether foreign or domestic, the lower Lehigh Valley can well be proud of its present production of fifty-five barrels a second.

OUR BIG CEMENT BUSINESS

A despatch from Allentown the other day announced the death of an octogenarian resident of that city, Tilghman H. Dorney, credited with having been the discoverer of the valuable limestone deposits that lie along the base of the Blue Mountains in Lehigh and Northampton Counties. Dorney is said to have discovered these deposits while engaged in prospecting for new veins of coal which he believed could be found in the lower Lehigh Valley. But, interesting and valuable as he rated the newly discovered limestone beds, he could not have dreamed then of the big industry which was to grow up with giant strides at the opening of the present century and give to a small corner of Pennsylvania an output of cement that, in quantity and value, puts Lehigh Valley cement in the forefront of that industry.

The story of the marvelous growth of the cement industry, increasing twelve hundred per cent. in a decade, due to the rapidly-growing and diversified uses found for reinforced concrete construction, has been told many times. But it is worth noting that in this little corner of Pennsylvania there was produced last year nearly twenty-five million barrels of cement, worth approximately twenty million dollars. This production was less than a third of that of the United States—for within the last decade the United States has become the greatest cement producing country in the world—and the extent to which the Lehigh Valley figured in this production can be judged by the fact that it now produces nearly three times as much Portland cement as the entire country turned out in 1900 and nearly as much as the entire produc-

tion of the one hundred cement mills of Germany, the second largest cement producing country.

But the pleasant little thirty mile stretch of hill and dale that begins at Coplay and Egypt, just beyond the busy little cities of Hokendauqua and Catasauqua, extending thence diagonally northeastward through Siegfried, Bath and Nazareth to Bangor and Portland, just below the Delaware Water Gap, is worth more than a half billion dollars for its cement producing minerals alone. For that would be its value were its annual output capitalized on a basis of a four per cent. return.

What cement has done and is doing is well known. The Panama Canal could not have been built without it. Our modern subways and big terminal improvements have been made possible by the development in concrete construction. To-day the worker in concrete designs not only buildings and other large structures, but we produce concrete barges, concrete lamp posts, street signs, letter boxes, bird posts, pipes and fences and some medical experts even have gone on record as holding that cement dust is good for tuberculosis.

It was not until 1866 that the first Portland cement was produced in Pennsylvania at Siegfried; five years later an active plant was set up at Coplay, and the Centennial year had almost arrived before cement making had become an established industry. One can imagine, however, the part Pennsylvania will play in the centennial of Portland cement when that anniversary is observed eight years from now. The brickmaker of Leeds, Joseph Apsdin, who discovered the chemical formula

BANQUET TO NICE VARNISH EMPLOYEES.

Sixty employees of Eugene E. Nice, maker of paints and varnishes, at 272-274 South Second street, were guests at a dinner given by their employer at the Hotel Walton. The dinner is an annual affair, originated by Mr. Nice several years ago. Mr. Nice said that the business of his concern during the last year had been the largest in its history, and plans were under way to broaden its field. He told the employees that a new varnish-making plant would be erected at State street and the Pennsylvania Railroad, Camden, N. J., to handle the business this year.

FIRE INSURANCE A VITAL FUNCTION IN MODERN LIFE

Destructible Property Valued at Approximately \$60,000,000,000 Under Protection of Policies at Present Time in This Country

By Frank Locke, Manager Atlas Assurance Company, Ltd.

Fire insurance must be deemed an integral element in the business and social constitution of all civilized countries; present day conditions could not be maintained without fire insurance or its equivalent. As some index of the extent to which it serves as a vital function it may be stated that destructible property valued approximately at \$60,000,000,000 is under the protection of fire insurance policies at the present time in the United States alone, including both policies issued in 1914 and unexpired policies of previous years.

Treating the year 1914 by itself, by taking the figures reported to the New York State Insurance Department and adding an estimated amount for companies not doing business in New York State, the total of all fire insurance transactions in the United States for the year may be summarized as the equivalent of one policy issued to "The People" for a sum insured of about \$40,000,000,000; the premium paid approximates \$390,000,000. The losses recouped to policyholders were about \$234,000,000, while the expenses necessary for the transaction of the business amounted to \$152,000,000. This statement shows a surplus amounting to \$4,000,000, or 1 per cent. only. It may be remarked that many individual citizens receive a larger net income from their investments than the profit in 1914 from premiums of all the fire insurance companies combined.

The compensation to stockholders for the capital risked is derived in part from interest upon invested funds, but as shown the premiums themselves furnished barely 1 per cent. margin over losses and expenses. This meager compensation is utterly inadequate as a reward for the hazards to which capital is exposed. While it is true that 1914 was in some respects abnormal in its results, yet the average of the previous twenty years shows a surplus much less than 1 per cent. as the contribution from premiums in the way of profit.

It is indisputable that this percentage would prove hopelessly inadequate to keep capital from deserting a business so fraught with hazard were it not that the sums held to the credit of policyholders for premiums on unexpired policies, added to reserves voluntarily held by the companies to meet the contingency of heavy conflagrations, admit of a certain amount of interest earnings, the additional compensation so derived being from the investment or banking side of the business, such as money can earn anywhere. Even then it becomes obvious that it is only those companies which are well endowed with surplus funds, and with management of more than average ability, which are able to main-

tain themselves under the present day strenuous conditions of the fire insurance business.

It is argued that an expense ratio amounting to over 39 per cent. of the premiums is needlessly high for the conduct of the business. While this is pressed with much insistence from many quarters no practical suggestion is made as to how the cost of transacting the business can be materially reduced. The principal item is that of commissions to agents and brokers, which constitute more than one-half of the total expense, thus naturally suggesting that the line of economy must be sought here.

It must be remembered, however, that the business of fire insurance is largely on a retail basis and therefore necessarily costly, the premiums on individual policies running from \$1 upward. Attention is being given to a possible readjustment of commission on a basis of payment in part by a flat commission and in part by an interest on profits, which arrangement if properly worked out may eventually somewhat reduce the cost of the business; what is much more important is that such a basis may reduce the aggregate amount of loss by a more careful selection of the business by the agents.

Taxation of all kinds absorbs more than \$3.00 out of every \$100 of premium paid, a percentage which can find no justification. It is an extravagant way of raising revenue whether for State or city, and nothing can be more short sighted than revenue measures of this kind, since it results that with an expense ratio of nearly forty cents out of every dollar paid the policyholders must pay about \$1.65 for every \$1 the authorities receive in taxes.

The amount of taxes levied in 1914 far exceeded the amount of profit which the companies received out of premiums paid. It therefore becomes a tax upon losses, not upon gains, thus being essentially wrong in principle as well as foolishly extravagant in the method of collection. It does not seem to be realized either by the public or by the authorities that all losses and expenses must be met out of the premiums, and that therefore it is much to the interest of the public that both losses and expenses should be reduced to the minimum instead of being made an extravagant channel for revenue.

A considerable amount of the expense incurred by the companies goes purely and simply to fire preventive work in the maintenance of technical laboratories for the study of all fire hazards and in the inspection of buildings and processes, of which inspections millions are made in the course of a year. Such expense is in the highest sense econom-

ical, and it is through such means that the fire insurance business is rightfully entitled to be reckoned the one paramount fire preventive force to keep down the enormous fire cost of this country.

The three great producers of the fire loss are:

- 1—Severe climatic conditions.
- 2—Temperamental carelessness of the community.
- 3—Heavy proportion of timber construction, especially of shingle roofs.

The two last of these are checked and controlled by fire insurance methods in a manner analogous to the control of disease by medical science.

One of the marked features of present day fire insurance aspects is the concentration of the business into fewer and larger organizations. Present day tendencies all favor the larger companies, the larger agencies and the larger brokerage firms. This is not to be wondered at when it is remembered that the rates of premium charged for the same risks are almost universally the same by all companies. There is therefore a natural drift toward size, age and prestige; the logic of events in this respect seems to be irresistible, hence the number of companies operating have a tendency to decline while those remaining increase in size and power. This is made manifest by the fact that twenty years ago there were reporting to the New York State Insurance Department some 120 independent companies having funds of \$200,000 or upward, while in 1915 the number had become reduced to about 110.

The financial conditions generally, due to well-known causes not necessary to recapitulate, had prejudicially affected the fire insurance business early in 1914. Recovery was being felt from this when the outbreak of the world war once more threw things into a tense and abnormal condition which is reflected in the fire insurance business. "Moral Hazard," so called, which means the occurrence of fires not purely accidental, has materially increased in certain sections of the country, especially in those sections where merchandise and produce became stagnant or unmarketable.

One phenomenal feature has been the unusual number of dwelling losses which have occurred where in many instances there is more than suspicion that money raised by the burning of a dwelling has been the means by which business disaster has been averted. In the history of underwriting this feature has never been so strongly marked as during the past few months, especially in certain sections of the country. To these causes must mainly be attributed the unprofitable nature of the 1914 business and the fact that 1915 shows but little signs of improvement. Due to the same business conditions is the fact that the premium income for the past year shows a marked tendency to decline so that there is but little prospect of substantial profit to the business as a whole for 1915.

The present tendency of the premium rate is for a steady decline. In 1914 the average rate was lower at about 1.02 per cent. than

in any year this century. The rapid extension of schedule rating is causing a steady decline in rate by reason of credits for improvements, which tendency is greatly helped by the increase in the equipment of buildings with automatic sprinklers. The effect of the strengthening of fire department equipments by the substitution of the motor for the horse and the general improvement in the water supplies of many cities are also marked features in average rate reductions.

The functions of the fire insurance business may be defined as threefold:

1—To protect the home from disaster resulting from fire.

2—To protect the business, the means of livelihood, by furnishing ability to resume after destruction by fire.

3—To protect the community, and even the nation, from disaster consequent upon conflagrations of the first magnitude.

It is apparent that the first two functions do not involve questions of prime importance, being local and individual, but the question of ability to meet a first class conflagration is not local or individual; it is not even a question merely State-wide; it is national. Take, for instance, the conflagration in San Francisco in 1906. It is obvious that had the fire insurance companies not been prepared with \$200,000,000 liquid assets immediately available, city, State and nation must all have suffered to meet an abnormal strain which actually was cared for with smoothness and celerity by the fire insurance funds contributed from all over the world. It is not too much to say that a national crisis was in this way averted.

Many large cities in the United States at the present time are quite capable of furnishing a loss by an individual fire which shall far transcend the calamity which visited San Francisco. The supreme function of the fire insurance business is therefore to be prepared for the emergency of immediately filling the breach so as to maintain confidence and restore normal conditions in the business and financial world with the least shock.

HOLMESBURG GRANITE COMPANY

The Holmesburg Granite Company has removed to new and commodious offices in the Commercial Trust Building, Room 410. This widely known concern, established fifteen years in its field, specializes in paving, building and bridge stone.

Among notable buildings to which the Holmesburg Company has recently supplied the stone have been the new Masonic Home, at Elizabethtown; the Catholic Home for Destitute Children, the Second Regiment Armory, St. Nathaniel's P. E. Church, the Dormitory Building of St. Charles Borromeo's, at Overbrook; the Wanamaker belfry tower at the cemetery of St. James the Less, and a host of others.

Don't lose your grip. Noah was 600 years old before he knew how to build an ark.

PAINTS MADE IN U. S. A. GO TO ALL PARTS OF THE WORLD

**No Other Country a Serious Competitor in This Article—
Zinc Oxide Basis of Big Industry**

G. B. Heckel, Secretary Paint Manufacturers' Association of the United States.

Few of us realize how intimately that commonplace material, paint, enters into and pervades our daily lives.

The houses we live in are painted, the fences that surround them are painted, the cars in which we ride, the structures on which they travel and the machinery that provides their motive power are protected and decorated with paint.

This is true also of a large proportion of the furniture, tools or utensils we daily use. Go where we will, look where we may, our eyes rest on painted surfaces.

It might be expected that a material so conspicuous in our surroundings and evidently so important to our comfort would challenge more than a passing interest. Yet, as a matter of fact, even the architect, who constantly specifies paint, usually gives it but slight attention; while to the consumer, whose property is protected or decorated with it, paint, as a rule, is just "paint" and nothing more.

Yet the manufacture of paint is an important American industry, in which many millions of capital are invested, and which turns out annually something like \$200,000,000 worth of products.

It consumes, in linseed oil, for example, between 15,000,000 and 20,000,000 bushels of flaxseed every year, and this seed is grown on an area of about 2,000,000 acres, giving in this single item large employment to the agricultural and shipping interests.

A peculiarly American feature of the industry is the manufacture of prepared paint. It began in this country a little over half a century ago and the annual output to-day is worth well over \$100,000,000. No foreign country approaches us in this respect. Even in England the annual output is still negligible, though prepared paints "Made in the U. S. A." are found in every civilized country.

Success Due to Zinc Oxide.

The success of the prepared paint industry was made possible by the introduction of zinc oxide as a commercial pigment. The story of this achievement reads like a romance.

In the city of Paris, about seventy-five years ago, there lived a painter named Le Claire. He was a good painter and took pride in a first class lasting job. But he was not satisfied with the materials he and other painters were using. He wanted a better, safer base for paint. He wanted something that would retain lustre—lessen chalking—retain color—put an end forever to poisoning.

After a great deal of experiment he found it—oxide of zinc.

And when Le Claire showed the French people buildings beautified by zinc paint which far outlasted and outlusted anything that they had previously seen they grew enthusiastic over his wonderful discovery. All over France people demanded that their houses be painted with zinc paint. They gave Le Claire all the work he could do—built up his modest business of house painting into a great concern—made his everlasting fortune.

Le Claire did not make prepared paints. Being a painter, he followed the old painter's routine of hand mixing for each job. It needed American genius to see the advantage of letting machinery do the work of preparation, and the physical properties of zinc gave the opportunity. White lead, the other important white pigment, is hard to keep in suspension in oil. It settles to the bottom of the can quickly and must be constantly stirred; whereas zinc is light and fluffy and easily remains in suspension and holds the other pigments up. Consequently the prepared paint industry was based on zinc oxide.

Big Changes in Ideas.

Paint was originally regarded chiefly as a decorative material, but it was soon discovered that the right kind of paint is also protective and preservative. As a result, our ideas regarding it have completely changed during the last ten or fifteen years, and there have been much research and specialization in the industry.

The Paint Manufacturers' Association of the United States, for instance, maintains at the Institute of Industrial Research in Washington fully equipped chemical, physical and bacteriological laboratories, where a corps of experts is constantly at work studying paint materials and painting problems. The results of these investigations go to the manufacturers in technical bulletins, and to the consuming public, through dealers, in the form of circulars, pamphlets, etc., written in untechnical language.

This Bureau, since its organization in 1904, has issued forty-six bulletins, twenty-six bound booklets, thirty-one circulars and twenty-six "tabloids" (envelope cards). The circulation of the booklets has exceeded 1,500,000 copies—of one of them, "The Paint Catechism," 600,000; of the little "tabloids," 25,000,000. This literature treats of paint in general as an economic proposition, and not of individual products.

This Bureau, as a result of testing and re-

An important part of a fence is in the ground

It's the anchorage of the posts that determines whether the fence will keep its alignment and stand straight and true after years of service.

"Recommendation"

A boiler recommended by all who use them is not necessarily a reason why you should buy that boiler. But it is perhaps a reason why you should see that boiler before installing any other.

The H. B. SMITH CO.
1225 Arch Street
PHILADELPHIA - PA.

BORDEN STOVE COMPANY.

The Borden Stove Company, manufacturers of stoves, furnaces, refrigerators and steam and hot water boilers, 118-120-122 N. Second street, Philadelphia, have been acknowledged leaders in their field for something like 37 years, during which they have given to the trade a series of lines of goods that have not only been meritorious from the quality view-point, but that have kept pace with every improvement that science and ingenuity have been able to devise within that period. The motto of the Borden Company has been "A correct appliance for every purpose." Announcement is made by the Borden Company that on and after January 1st, 1916, this fine old concern will handle exclusively the "Adelphia" brand of ranges, warm-air furnaces and steam and hot water boilers. The "Adelphia" line involves improvements both as to pattern and service possessed by no other line on the market. It will consist of the long established and widely known Borden quality plus a policy designed to protect and promote the interest of Borden dealers. Sales will be made to legitimate dealers only, who will not only be carefully protected as to their agency rights but as carefully defended against installation or operation "cut" prices. Every piece of goods sold under the name "Adelphia" is guaranteed by the Borden Company, who back up the quality thus insured to their patrons by Borden service—prompt delivery.

The Borden Company will be glad to welcome to its show rooms architects, builders, stove or heater men who care to inspect the splendid line of ranges, warm-air furnaces, steam and hot water boilers there on display, or to show them other specialties of the company's large and varied line.

A post card will bring the new catalogue to persons interested. Address the Borden Stove Company, 118, 120, 122 North Second street, Philadelphia.

MERCHANT & EVANS CO.

The Merchant & Evans Company, one of the landmarks in the growth of Philadelphia into a great commercial and manufacturing center, has removed from the building at 517 Arch street, which it has occupied for twenty-eight years, to larger and more commodious quarters at 2019-35 Washington avenue. This firm, one of the oldest and most widely known in the trade, has been continuously engaged in the metal manufacturing line for half a century, and is said to have a clientele exceeding 30,000 accounts scattered throughout the country. Mr. Powell Evans is the president of the company.

**Messrs. Frank V. Warren and Thomas R. Moore, formerly with Cramp & Co., and George S. Worth announce their incorporation, under the name of Warren, Moore & Co., to engage in general contracting and building construction, with offices at 519 and 520 Commercial Trust Building, Philadelphia, Pa.

search, has reached some conclusions of interest to every painter, paint dealer and paint consumer. Among those conclusions are the following:

"Two or more of the prime white pigments (basic carbonate white lead, basic sulphate white lead and zinc oxide) in combination, with or without a moderate percentage of inert reinforcing pigment, make a paint that is in every way superior to paint made from a single pigment.

Prevents Disintegration.

"Concrete and cement surfaces can be successfully and satisfactorily painted with ordinary high-grade linseed oil paints, and thus preserved from disintegration.

"Certain types of paint promote the corrosion of steel in the presence of moisture; others inhibit or retard it. The latter should be used in priming coats for steel structures. (Incidentally it is interesting to note that zinc is one of the best of these so-called "Inhibitive Pigments.")

"Shingles can be protected from fire due to flying cinders, brands or sparks by the use of ordinary metallic oxide paints. Therefore paint the roof and prevent fire.

"Rosin and rosin oil appear to promote early cracking of the paint film and therefore should not be used in house paints.

"Oil paints in drying give off germicidal vapors; therefore the painting of interior walls is efficient disinfection.

"Light colored paints transmit more heat than dark colored paints or the so-called bronzes. Radiators should therefore be coated with light tinted paints or enamels."

The Bureau also maintains a number of paint test fences in various parts of the country where the behavior of various types of paint for different purposes is under constant observation.

The conclusion of the Bureau as to the superiority of paints containing several rather than one pigment is corroborated by the American Society for Testing Materials, which in its report on the wear of paints tested on its own fence at Arlington, Virginia, states that:

"None of the paints composed of a single primary pigment is equal to the paints made up with composite pigments except zinc-lead white, which is actually a composite pigment.

"In the binary and ternary (two and three) series the groups containing zinc oxide show less cracking and checking and a whiter and cleaner surface than those groups in which it is absent.

"The present conditions also seem to warrant the statement that the quarternary (four pigment) series is in the best condition of any of the panels included in the test."

Present Day Paints the Best.

It may be confidently stated that the better grades of house paints are better to-day than ever before as a result of the serious study that has been devoted to the subject by technical men in recent years.

Among the conclusions of the Educational Bureau noted above, that regarding the sanitary value of paint is important. It has

been found that paint in drying gives off, among other things, formaldehyde, and that germs cannot live in the presence of paint vapors. Consequently one of the best possible ways to disinfect a room or a house is to paint the walls.

Fortunately flat wall paints were introduced just before this discovery was made; and the consumer was given a highly satisfactory material with which to decorate and disinfect at the same time.

This same flat wall paint is another of the romances of the industry. It depends for its flatness upon two ingredients—China wood oil and lithopone, which together produce cheaply and easily a flat drying solid paint, which can be washed. Lithopone, a compound of zinc, barium and sulphur, was introduced to the trade less than twenty years ago, and China wood oil at about the same time.

The consumption of both has grown enormously and the flat finishes produced from them have made serious inroads into the wall paper business.

Periodically during the past three years there has swept over the country, in constantly growing intensity, a wave of enthusiasm for cleanliness and sanitation; so that the annual "Clean-up Week" bids fair to become a national institution.

The inevitable accompaniment and sequel to a "clean-up" campaign is a "paint-up" carnival. The results of cleansing and disinfection are made visible and permanent by putting on a coating of beauty or protection where they are needed.

Paint Also a Disinfectant.

Paint, of itself, as has been shown, is in no slight degree a disinfectant. The Assistant Director of the Institute of Industrial Research, at Washington, D. C., Henry A. Gardner, clearly demonstrated this some time since by preparing two cultures of typhoid bacillus in gelatine. One he placed overnight in an unpainted room and the other in a room that had been freshly painted. The next morning the culture from the painted room was dead, while that from the unpainted room had grown throughout the mass of gelatine.

Nothing is so clean as fresh paint and nothing looks so clean. Furthermore, the painting habits of a property owner are taken by the banks and financial institutions as a fair index of personal character and general habits. Some of the leading agricultural papers have been making inquiries on this subject, with the unexpected result that the bankers state that they are always willing to lend from twenty to forty per cent. more to a man who keeps his building well painted than to a man who neglects his painting.

Paint is also an important adjunct to conservation. Now that the whole country has been awakened to the necessity of conserving our natural resources, it is well for each of us to remember that he can contribute his quota of conservation by protecting the lumber in his own buildings with paint. Unpainted wood will decay, but wood properly painted and repainted at proper intervals is practically eternal.

The proper interval for repainting is from three to five years, depending on conditions; but there is no arbitrary rule—a surface should be repainted when it needs repainting. The first painting, on new wood, should be three coats (never fewer) and the repainting, two coats. All loose paint should be removed before repainting, otherwise the fresh paint will not secure a firm hold.

Paint Preserves Shingles.

Shingle roofs will last indefinitely if regularly painted like the rest of the house, and a painted shingle will not only lie flat, thus remaining watertight, but it will not take fire from flying brands or sparks.

A tin roof should have at the beginning two coats of paint, and after that a single fresh coat at intervals of not less than two or three years.

For interior wall decoration nothing is more permanently pleasing or more completely satisfactory from a sanitary point of view than the modern flat interior finishes already mentioned. These can be obtained in any tint or shade; they produce a velvety surface without glass and can be lightly washed with neutral soap and water when soiled. Most important of all, they are germicidal when fresh and practically germ-proof when old, since they afford no lodgment for dust and can be sponged off in the course of regular housecleaning. No one who has tried this type of wall decoration will tolerate any other.

For bathroom and kitchen, next to tiling, which, of course, is best, varnish enamels are preferable. These are made with zinc oxide ground in a good water resistant varnish. White is the preferred color for the bath room, but tints are more suitable for the kitchen. For the latter, however, if the enamel treatment is regarded as too expensive, ordinary oil point or the flat interior paint already mentioned will be satisfactory.

Don't Neglect Back Fence.

And while preserving, "sanifying" and decorating the interiors and exteriors of our dwellings, let us not forget that the back fence is also a part of the house, and that it contains lumber that is worth preserving. It costs very little to paint a fence once every three or four years, but it costs a good deal to renew the fence when it has rotted for lack of paint.

The selection of paint is an important matter, but, after all, presents no serious difficulty. The most important item in the process is the selection of the painter. In him honesty, skill and experience are essential qualities. But besides this, he should be up-to-date. Painters, like the rest of us, are too often tied to tradition and routine—a few keep abreast of the times. The up-to-date painter will know that he can give his customer better value with a combination of zinc and lead than with either alone, and the question, "Do you use zinc with your lead for outside painting?" is worth asking. The answer will indicate the extent to which he has been modernized.

Prepared paints, bearing on the label the name and address of a responsible manufacturer, can generally be relied upon to give

good value and good service. They are based on white lead, zinc oxide and linseed oil. They have the advantage of uniformity of composition and the additional advantage of

the accuracy of preparation insured by machine mixing. Furthermore, they contain all the necessary ingredients, and, therefore, are practically "fool-proof."

BANKING IN PHILADELPHIA

How Philadelphia Has Led in the Financial History and at Every Crisis in the Development of This Country.

In the financial history of Philadelphia the most remarkable fact is that, at every important crisis, the National Government has turned to this city as its main resource against financial disaster.

Robert Morris financed the Revolution, aided by Philadelphia colleagues; Stephen Girard, almost alone, carried the financial burden of the War of 1812; E. W. Clark negotiated the necessary loans for the Mexican War, while the heroic efforts of Jay Cooke tided the national finances over the stress of the Civil War.

William Penn, the founder, gave the first impetus of fair play, and strict, equitable dealings which have since dominated the commercial life of Philadelphia, making it for more than two centuries the veritable keystone of the financial arch in this country.

A plan for a local bank had been discussed in Philadelphia as early as 1763, but the first definite proposal on the subject came from Alexander Hamilton, in 1779. This led to the temporary committee of organization, founded in 1780 at Philadelphia by Robert Morris and others, for the purpose of sending supplies to the Revolutionary Army. It was popularly known as the "Bank of Pennsylvania," and proved the chief reliance of the Government in keeping the army equipped in the field until the close of the war. As an inchoate "bank," it continued in operation about eighteen months.

Robert Morris was the financier of the Revolution, and when Washington's half naked, half starved troops were at Valley Forge it was Mr. Morris who gave his entire fortune to provide for the patriot army. Having no means of his own after the war, and owing to the existence of a Debtor's Law, Mr. Morris was imprisoned because of his inability to pay his own personal debts. He took no form of obligation whatever from the Government, and received nothing in return for the large sums spent in its behalf. His body lies buried in a quiet corner of Christ Church, Philadelphia, with only an ordinary marble slab to commemorate his services, but, be it said to the credit of the Bankers of Pennsylvania, that through the co-operation of the State they have raised a fund of \$35,000 to insure the erection of a monument to his memory.

It was Robert Morris, who, in 1781, submitted to Congress the first definite plan to incorporate a national bank. This resulted in a charter by Congress, May 26, 1781, establishing the Bank of North America, at Phila-

delphia, the first in this country. The second, the Bank of Massachusetts, at Boston, was chartered February 7, 1784, and the third, the Bank of New York, at New York, on June 9, 1784. When the Federal Constitution was adopted in 1787, these three were the only organized banks in America, but the Bank of Pennsylvania was revived shortly after under State auspices.

Congress chartered the first Bank of the United States in 1791, locating it at Philadelphia, and it remained in this city throughout its chequered career.

A fourth bank was added to the financial resources of the city by the incorporation of The Philadelphia Bank, in 1803. Its rapid growth and success added to the banking supremacy of this city, which it maintained well into the century, when the Erie Canal and foreign commerce sent New York to the front.

During the period following the Revolution, Stephen Girard became the foremost merchant and "wealthiest man in America." When the first Bank of the United States was dissolved, in 1811, he bought from the Barings, in London, most of its stock held abroad and became its principal creditor. He decided to open a private bank of his own, which he did, in May, 1812, and occupied the building which had been erected for the Bank of the United States, on Third street; it has since become the home of the Girard National Bank.

Twice during the War of 1812, Girard took up the loans of the United States, first in March, 1813, and again in the extreme stress of December, 1814, and thus saved the Government from going into bankruptcy.

The year 1812 was also marked by the organization of the Pennsylvania Company for Insurance on Lives and Granting Annuities, the oldest corporation in the United States to which has been granted trust company powers.

In the period of fluctuation and stress which led to the suspension of the Second Bank of the United States in 1841, the Philadelphia banking institutions steadily held their own, and in fact, formed the main bulwark of the country against a general panic, as they have in virtually every subsequent crisis. The resources of the city were sufficient, in 1847-48, to enable a leading banker, E. W. Clarke, to carry through the necessary Government loans for the Mexican War.

Upon the passage of the National Bank Act by Congress, in 1863, Philadelphians were the first to accept and act upon the new condi-

tions, the first charter under the new system being issued to the First National Bank of this city on June 20, 1863.

It was, in part, the activity of Jay Cooke, of Philadelphia, in financing the loans of the great transcontinental railroads that made the Government again turn to Philadelphia in the pressure for funds and credit of 1863-64. Mr. Cooke so ably sustained the prestige of Philadelphia bankers for unselfish patriotism, that his service was recognized by President Lincoln as one of the most essential contributions to the success of the Union cause. In this work, Mr. Cooke was generously supported by all the banking institutions of the city, both in direct contributions and the taking up of United States loans.

The inception of the American Bankers' Association took place at Philadelphia during the Centennial of 1876, and in all the subsequent years the city has maintained its unbroken prestige for financial solidity and strength, especially during the crisis of 1907.

In the special analyses accompanying the recent discussions before the Federal Reserve Board to determine the location of regional banks, it was shown by official figures that Philadelphia has thirty-two national banks and seventy trust companies, State banks and savings banks. These 102 financial institutions show total working capital of \$203,000,000 and aggregate resources of \$1,065,369,000. In addition were held individual trust funds, kept strictly apart but adding greatly to the financial strength of the city, to the amount of \$856,000,000. Financial settlements made in 1913 through the National Banks of Philadelphia aggregated \$8,523,500,000. In point of financial ability Philadelphia ranks second only to New York in the western hemisphere, and her relative position has been steadily advancing during the last ten years.

DON'T BUILD OLD ONES.

On the train going out, Subbubs got into conversation with a stranger, who remarked:

"I see you are putting up a good many new buildings."

"Yes," answered Subbubs; "new buildings are the only kind we put up."

SOMETHING TO DO.

"This cottage," the agent said impressively, during the signing of the lease, "is just a stone's throw from the station."

"Good," said the man. "That will give us something to do on the long summer evenings."

"Yes?" said the agent, with a puzzled smile. "Yes? How so?"

"It will give us something to do, Isaid, on summer evenings," the man explained. "We can sit on the front porch and throw stones at the trans!"

Lots of men don't advertise because they cherish an idea it's too expensive. As a matter of fact, it's the cheapest good investment a man can put his money in, as hundreds of successful men have learned.

The Original and Only SOLID WIRE GLASS Made by the Continuous Process

Fully approved by the National Board of Fire Underwriters as a fire retardant, and recognized by them as "SOLID WIRE GLASS."

BORO-CARBONE.

The New Abrasive, Said to Be the Most Modern and Efficient Grinding Material Known.

Boro-Carbene is the product of the electric furnace, and is the most modern and efficient of all aluminous abrasives. Abrasive wheels made of this material are fast cutting, long lived, and produce a maximum amount of work. This material is carefully prepared for wheel use, and is producing wonderful results.

"The binding materials used," say the manufacturers, "are the result of long scientific research, and, coupled with the best of manufacturing facilities and methods, we are in a position to make prompt deliveries."

"We are constantly testing in our laboratories all raw materials, and use only the best obtainable. The bond by which the particles are held together has in itself abrasive properties, so every particle of our wheel cuts."

All abrasive wheels will run wet or dry, and the nature of the process by which they are manufactured is such as to insure cool, free-cutting, efficient wheels.

Boro-Carbene is oxide of alumina (Al_2O_3) in crystalline formation. It is produced by fusing Bauxite in the intense heat of the electric furnace, by what is known as the arc process. The richest and best Bauxite deposits of the world are found in southern France, and only the very best Bauxite from these mines is used in the manufacture of Boro-Carbene. Boro-Carbene is the trade name given by the Abrasive Material Company of Philadelphia to their material which is made in France. Boro-Carbene possesses all the desirable qualities required in an abrasive suitable for grinding wheels. Natural abrasives contain a variable percentage of impurities in the form of iron and silica, which decrease their efficiency. This condition does not exist in Boro-Carbene. Bauxite, from which Boro-Carbene is made, was considered infusible until the arc process was adopted in electric furnace work.

The purity of the material used, and the process of its manufacture, both in testing and cooling in crystallization, makes Boro-Carbene

superior in quality, hardness, sharpness, uniformity and temper. The manufacture of Boro-Carbene is under control which enables it to be made uniform in temper. This temper can be varied according to the kind of grinding it is required to do. Its physical formation is such that it leaves sharp cutting points when fractured. Grinding wheels made of this material are used extensively in all kinds of grinding and all classes of work, but are perhaps most satisfactory in grinding material of high tensile strength, such as all kinds and classes of steel.

Boro-Carbene possesses the property of resisting heat, and can be used successfully in the manufacture of many kinds of refractories.

Baurite was originally discovered in France, the home of Boro-Carbene. This soft refractory substance, when treated in the electric furnace, is completely melted, and flows like water. The heat generated by the electric arc is estimated at about 2,100 degrees Centigrade, or about 3,800 Fahr. Any iron impurities in the mass are vaporized, and such impurities in the Bauxite are eliminated. After the Bauxite is melted and crystallized it is then ready to be crushed in various size grains.

Boro-Carbene is graded into the following grains: Nos. 10, 12, 16, 20, 24, 30, 36, 46, 54, 60, 70, 80, 90, 100, 120, etc., etc., after which it is ready for wheel use.

Boro-Carbene Wheels are made by the following processes, namely: Vitrified, Silicate or semi-Vitrified and Elastic.

By far the greatest percentage of the wheels are made by the Vitrified process, on account of the open porous texture obtainable, which makes them superior for most grinding operations. This process undergoes high heat treatment by the use of large and specially designed kilns.

Abrasive wheels made by the elastic process are flexible and possess a high degree of safety, which makes them valuable for work requiring thin wheels. They are used mostly for light grinding operations, such as saw gumming, planer knife grinding, slot grinding, roll grinding, etc. They are made as thin as 1-32" in small diameters. They can be furnished 1-16" thick up to 8" diameter, and 1/8" thick up to 12" diameter.

Chanelath RIBBED EXPANDED METAL

"Chanelath" is a new expanded metal product consisting of T-shaped ribs $\frac{7}{8}$ inches high, spaced 4 inches apart and joined together by an expanded metal fabric of small meshes as shown in the illustration.

"Chanelath" is specially suitable for all kinds of plastering work where auxiliary studding or furring is required for the T-rib acts as a studding or furring.

"Chanelath" is also designed for use as a combined form and reinforcing in the construction of concrete roofs and floors. In this work the fabric acts as a form and also as a reinforcing, but the greatest reinforcing value is in the T-rib.

NICE

Liquid Filler

The first Liquid Filler made and the best, answering every requirement of Nice Standard.

Wood Fillers are the trade's stand-bys. You can shoot at them from any standpoint without making any impression.

They are economical in time, labor, material; and produce wonderful results. In addition they are indispensable to every painter and finisher because of their adaptability to other uses.

A postal will bring you samples and catalogue free.

Eugene E. Nice, Philadelphia

LEATHERFLOOR

A COMPOUND OF LEATHER

A Superior Sanitary Flooring

The highest degree of efficiency in composition flooring has been obtained in Leatherfloor. It is fire-proof, water-proof, dust-proof, germ and vermin-proof, noiseless, non-slipping, flexible, elastic and inexpensive.

GOLD MEDAL AWARDED BERLIN STEGLITZ Leatherfloor is admirably adapted for floors, base and wainscoting, in Hospitals, Asylums, Schools, Churches, Libraries, Theatres, Hotels, Restaurants, Apartment Houses, Factories, Stores, Banks, Steamships, Yachts, Railroad Cars. Etc., wherever a smooth, sanitary, fire and water-proof flooring is desired.

Leatherfloor is the Best

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation.

Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases.

Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

Write for Booklet.

The Standard Documents of the American Institute of Architects

The New Contract Documents of the American Institute of Architects are now on sale and replace the old Uniform Contract, which is to be discontinued

PRICES FOR SINGLE COPIES

Agreement and General Conditions in cover	\$.10
Bond of Suretyship	02
Form of Subcontract	02
Letter of Acceptance of Subcontractor's Proposal	01
Complete set in cover	15

Trial set delivered upon receipt of nine 2-cent stamps.

These Documents have received the full approval of the Institute, through its Convention, Board of Directors and Officers. They are the outcome of nine years of continuous work by a Standing Committee on Contracts and Specifications. This Committee, comprising some of the ablest American architects, was assisted by the Institute's forty Chapters; advised by eminent legal specialists in contract law and aided by representatives of the Building Trade Associations of the United States. The forms have been officially approved by the National Association of Builders' Exchanges, the National Association of Master Plumbers, and the National Association of Steam and Hot Water Fitters.

Wells, Heed Building, Philadelphia, is figuring. Plans may be obtained from architects on deposit of \$10.00.

A DROP OF INK.

A drop of printer's ink
May make a thousand think.

A single drop

May keep your shop
From getting on the blink.

A drop, when hardly dry,
Makes many people buy.

It helps your biz',

And therefore is

A goodly thing to try.

—Ex.

You can't achieve anything worth while, whether it's peddling pills or discovering uncharted rivers, without advertising. If Columbus hadn't gone back and kicked up a racket about it, nobody in the Old World would have known yet that he had discovered anything.

"The knowledge of to-day may be the ignorance of to-morrow. Then where are you unless you keep posted from day to day?"

Beaumont, Stephen Girard Building, and Warren, Moore & Co., Commercial Trust Building, Philadelphia.

The world is just chock full of men who failed because they expected buyers to romp right in and ask for goods. Modern business spends big money simply to get the buyer interested knowing that sales follow.

One secret that has been fairly well kept is the secret of success. Strange, too, when so many people are anxious to tell about it.

Miscellaneous

Philadelphia Bank (O), 421 Chestnut street. Horrocks Iron Works (O), 234 North Broad street. Cost, \$1,500. Bank building, 421 Chestnut street.

P. & R. R. Co. (O), Twelfth and Market streets. Cost, \$400. Battery house, Cresson street and Carson street.

Joseph Sagore (O), 1130 Day street. Louis Cohen (O), 922 Orianna street. Cost, \$350. Store and dwelling, 1123 North Howard street.

Anna M. A. Weiss (O), 5907 Haverford avenue. Cost, \$300. Shop and store rooms, Fifty-ninth and Haverford avenue.

General Smelting Co. (O), Bullitt Building. James G. Farrel Co. (C), 1621 Sansom street. Cost, \$950. Smelting Building, Westmoreland and Richmond streets.

C. E. Shedaker (O), Tenth and Lombard streets. Basch & Co. (C), 1426 South Front street. Cost, \$1,800. Store, Eighth and Walnut streets.

J. John Guether (O), 4501 North Seventeenth street. Stocker & Hastings (C), 1320 North Carlisle street. Cost, \$1,000. Store and dwelling, 4501 North Seventeenth street.

M. E. Oldham (O), 1523 Arrott street. Cost, \$450. Garage, 4458 Griscom street.

E. T. Statesbury (O), Drexel Building. Paul J. Essick (C), 1345 Arch street. Cost, \$3,000. Dwelling, 1723 Locust street.

T. Scott Root (O), Somerton, Pa. J. K. Logan (C), Beth Ayres, Pa. Cost, \$435. Dwelling, Bustleton pike and Byberry road.

Robert Freeman (O), 411 South street. A. Kirpichnikoff (C), 1110 North Forty-first street. Cost, \$2,400. Store and dwelling, 411 South street.

George W. Smith & Co. (O), 3907 Powelton avenue. John N. Gill & Co. (C), Heed Building. Cost, \$6,000. Lumber shed, Baring and State streets.

John S. Quade (O), 226 North Sixty-fifth street. Cost, \$3,000. Dwelling, 226 North Sixty-fifth street.

H. W. Genter (O), 2439 North Second street. N. M. Bean (C), 4411 Germantown avenue. Cost, \$500. Dwelling, 2330 Jefferson street.

Pasquale Del Vecchio (O), 808 Christian street. Frank Bilotta (C), Seventh and Christian streets. Cost, \$800. Store and dwelling, 806 and 808 Christian street.

Edwin H. Fitler (O), Tacony and Sanger streets. Charles A. Collier (C), 1370 Gillingham street. Cost, \$3,200. Garage, Tacony and Sanger streets.

Toby Lasco (O), 6135 Woodland avenue. Cost, \$2,000. Store and dwelling, 6119 Woodland avenue. Peter D. Sciascio (C), 928 Tasker street.

Tony Franks (O), 3541 North Ninth street. Cost, \$350. Dwelling, 542 West Rising Sun Lane.

Cunningham Piano Co. (O), Eleventh and Chestnut streets. D. W. O'Dea Co. (C), 5227 North Fifth street. Cost, \$450. Garage, Fifth and Parkside avenue.

Naval Militia of Pennsylvania (O), Parkway Building. Thomas M. Seeds, Jr. (C), 1207 Race street. Cost, \$800. Armory, Broad and Callowhill streets.

J. J. Fitzgerald & Co. (O), 3800 North Second street. William J. Jones (C), 2927 North

Fifth street. Cost, \$450. Wagon house, 3800 North Second street.

Edward Derr (O), 218 East Willow Grove avenue. John E. Walt (C), 204 East Willow Grove avenue. Cost, \$568. Dwelling, 218 East Willow Grove avenue.

William Morris (O), 3214 Ridge avenue. M. J. Benamy (C), 3042 York street. Cost, \$925. Store and dwelling, 2342 North Twenty-ninth street.

Children's Hospital (O), 207 South Twenty-second street. H. B. Coyle Iron Works (C), 622 Filbert street. Cost, \$400. Hospital, 207 South Twenty-second street.

S. Kivialkowski (O), 2701 East Cambria street. John W. Jeinyszeki (C), 3169 Felton street. Cost, \$550. Store and dwelling, 2701 East Cambria street.

Colonel Lee S. Sturris (O). Thornton & Co. (C), 2643 North Hutchinson street. Cost, \$750. Store, 13 North Third street.

Acme Tea Co. (O), Fourth and Willow sts. E. H. Sturts (C), 2614 Ridge avenue. Cost, \$500. Store, 3 stories, 1600 Frankford avenue and 4300 Frankford avenue and Sixty-first and Lombard streets.

Walter H. Ottman (O), 419 South Fifty-second street. Basch & Co. (C), 1436 South Front street. Cost, \$315. Store, 20 North Fifty-second street.

George Vaux, Jr. (O), Bryn Mawr, Pa. James Spear Heating Co. (C), 1823 Market street. Cost, \$720. Apartments, 1704 Arch street.

A. R. Kessler (O), Eleventh and Green sts. Fred A. Meyers (C), 5132 Brown street. Cost, \$300. Garage, Eleventh and Green streets.

Aaron S. Wist (O), 6707 North Eighth st. Cost, \$350. Dwelling, 6707 North Eighth street.

Phosphor Bronze Smelting Co. (O), Twenty-second and Washington avenue. J. M. Smith & Sons (C), 1425 Spring Garden street. Cost, \$700. Factory, Twenty-second and Washington avenue.

Mastbaum Bros. & Fleisher (O), Finance Building. Basch & Co. (C), 1136 South Front street. Cost, \$400. Store, 926 and 928 Market street.

Samuel Rosen (O), Franklin and Poplar streets. Max Kane (C), 871 North Franklin street. Cost, \$375. Store and dwelling,

William Cramp Ship Building Co. (O), Franklin and Poplar streets. Beach and Ball streets. Hoffman Eng. and Cont. Co. (C), Pennsylvania Building. Cost, \$3,500. Storehouse, Cumberland and Richmond streets.

Morris Wecht (O), 237 Fairmount avenue. Cost, \$300. Dwelling, 621 North Franklin street.

Brick Estate (O), 1227 Germantown avenue. C. Fischer (C), 725 Spring Garden st. Cost, \$700. Storage, 1227 Germantown avenue.

G. L. Soloman (O), Eighth and Passyunk avenue. M. Di Sciascio (C), 928 Tasker st. Cost, \$700. Store and dwelling, Eighth and Passyunk avenue.

Rev. John A. Kuggan (O), 842 South Fifty-seventh street. Joseph Price (C), 2048 Rittenhouse street. Cost, \$300. Store, 1206 Chestnut street.

Board of Prison Inspectors (O), Tenth and Reed streets. H. E. Baton (C), Twelfth and Sansom streets. Cost, \$94,000. Prison, Torresdale avenue and Pennypacker Creek.

Otto G. Kuehne (O), Opal and Germantown avenue. Cost, \$700. Store and dwelling, 2273 Gratz street.

Louisa Green (O), 512 South Fifth street. Nathan Rosenzky (C), 520 Dickinson street. Cost, \$600. Dwelling, 1204 Annin street.

Harry Brocklehurst (O), 3621 North Sixth street. Cost, \$1,400. Garage, 3618 North Randolph street.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

****A TESTIMONIAL DINNER** was given on Wednesday evening last by George J. Watson, president of the Master Builders' Exchange, at the Union League, to the 100 members who waged a six days' campaign the previous week for 1,000 new members. Prizes were awarded to the five "two men" teams most active in the campaign. Nelson Mayhew was presented with a handsome gold mantel clock by fellow members for his good work in the campaign. Cash prizes aggregating \$300 were distributed among the following: O. W. Ketcham, C. F. Schellenberger, Harold Smith, Charles Kates, James S. Talley, Roy Griffith, John Coghlan, V. C. Trout, Albert McCheeney and A. J. Hammett.

****CLOSING SESSIONS WERE HELD** on Thursday of the eighth annual convention of the Retail Marble and Granite Dealers' Association of Pennsylvania, at the Adelphia. Officers of the association were elected as follows: President, R. H. Koontz, of Greensburg; vice-president, J. M. Gessler, of this city; secretary, A. H. Luckenbill, of Middletown; treasurer, M. H. Curry, of Meadville; sergeant-at-arms, George Detweiler, of Phoenixville; members of Executive Committee, G. W. Caldwell, of Pittsburgh; H. A. Mason, of Erie, and E. E. Shaeffer, of Kittanning.

****CHARLES W. A. VEDITZ**, the United States Commercial Attache in Paris, has sent the following cablegram to the Department of Commerce: "Important semi-official exposition of methods and materials for reconstruction and improvement of houses, factories, farms, highways, public works, villages and cities to be held here, May, June and July next, under the patronage of the President of France, several Cabinet members and the leading engineers, hygienists and business men. The United States is apparently the sole foreign country admitted to participation. The director of the American section, Henry C. Long, No. 5 Opera Square, Paris, whom interested parties should write or cable promptly, can furnish managers and salesmen for exhibitors. Space rates, 80 francs per square meter plus 1 per cent. of exhibitor's sales. One-half rental should accompany request for space, payable Edouard Tijou, Administrateur General, No. 16 Rue Taitbout, Paris."

****P. H. KELLY WAS ELECTED** president of the Master Builders' Association at a meeting at the Continental Hotel. George Biddle, Frank Lines and A. W. Ruth were elected vice-presidents. James Connor was elected secretary and James Beehtel treasurer.

****WHAT IS DESCRIBED AS THE FIRST**

American complete building show will be held in Cleveland, O., February 16 to 26, 1916, under the direction of the Cleveland Chapter, A. I. A., in co-operation with the Cleveland Chamber of Commerce, Art Association, Builders' Exchange and other civic bodies. One of the features of the show will be an architectural competition for a workingman's home to cost not more than \$3,000 complete, exclusive of land and embellishments. There are seven prizes, the first being \$200. The contest is open to all materials. The rules of the competition call for six rooms, with basement under entire house. All drawings must be in by February 1. Instructions regarding the contest may be obtained by applying to the Complete Building Show Co., 356 Leader-News Building, Cleveland.

****PENNSYLVANIA & ATLANTIC SEABOARD HARDWARE ASSOCIATION** will hold its annual convention at Pittsburgh, Pa., February 8-11. The headquarters will be at the William Penn Hotel. W. P. Lewis, Huntington, Pa., secretary.

****McLAURY MARBLE & TILE CORPORATION**, Walnut avenue and East 141st street, New York City, announces that D. H. McLaury is no longer connected with that corporation. This firm was formerly the D. H. McLaury Marble Co. and the McLaury Tile Co.

****LEON S. MOISSEIFF**, consulting engineer, has opened an office at 69 Wall street, New York City, for the general practice of his profession. Mr. Moisseiff was formerly connected with the Department of Bridges of the City of New York as chief of the Division of Design.

****NATIONAL CONFERENCE on Concrete Road Building** will be held at Chicago, Ill., February 15-18, 1916. J. P. Beck, 208 South La Salle street, Chicago, secretary of the Advisory Committee.

****DAVID L. STINE**, architect, announces that his son, Sidney L. Stine, has become associated with him in the practice of architecture and that the business will be conducted hereafter under the firm name of David L. Stine & Son, with offices at 405 Valentine Building, Toledo, Ohio.

Editorial Comment

"After reading last week's article on advertising building materials some one asked," says the "Ledger," "'How can a general contractor advertise?' Which, of course, means how he can obtain the right kind of publicity; the kind that will do more than fill advertising space and cost money—in a word, the kind that pulls.

"The principles of advertising are the same whether you are endeavoring to sell books, bricks, or office buildings or seeking to get your name on the architects' lists. The only things that change are the manner and methods of publicity. A general contractor must therefore adopt methods suitable to his own particular business, which, by the way, is decidedly different from any other type of business, and must have its advertising done and copy written by men who understand, in a most comprehensive manner, the details and intricacies of the building trade.

"Then, again, the advertising must be of a twofold nature, inasmuch as its appeal must reach both architects and owners—two different types of men, and in most cases with very little in common so far as their training is concerned.

"To the architect, the builders' advertisement must appeal with such riveting force as to be ever before him. If not in a physical manner, at least mentally it must make a little dent in his mind and 'ring the bell' at the psychological moment when the architect is making up his list of bidders, and the nearer the top of the list the better his chance of always being among the favored few.

"You (Mr. Builder) may say that you already do enough estimating and are now working overtime trying to land jobs. Are you on the lists of all of the prominent architects, the men for whom you would like to estimate? Are you in a position to select the good prospects and avoid the poor ones? In a word, are you competing against men who do the same calibre of work that you are doing, or are you forced out of your class because you are not on the chosen lists? If you cannot answer these questions to your entire satisfaction, then you are ready for serious thought on the question of advertising."

* * *

First concrete results were seen last week of the work of the commission which for two years has been laboring with a plan for creating trade and residential districts in New York, limiting the height of buildings and limiting the area of lots on which buildings may be erected. Their tentative plans have been completed and at a public meeting to be held on February 3 in the rooms of the Merchants Association in the Woolworth Building they will be submitted to all persons who may be interested for discussion and criticism. If any reasonable suggestions are

made for altering the plan such alterations will be made, after which the matter will be placed before the Board of Estimate to be approved by it and made part of the city law. The power to district the city, limit building heights and area of lots occupied by buildings was granted to the Board of Estimate through Charter amendment in 1914.

Of the plan as it stands now its makers say it is only tentative and subject to radical revision if the necessity is shown. Indeed, the members of the commission, eager to meet the views of the great majority of land owners and residents, have laid out a scheme which will be called most conservative by those who judge it from the standpoint of benefit to the whole city though some property owners may feel that their rights are invaded. They, however, are likely to form a small minority.

* * *

In working out its various schemes the sub-committees were in consultation in every borough with many authorities on the subjects considered. Use districts, height districts and area districts are the result. In the use districts, residential districts are those from which business and industry will be excluded. Business districts are those from which objectionable trades and industries and the larger type of factory will be excluded. The remaining portions of the city will be left unrestricted as to use. This will include all areas where an industrial use is anticipated and also certain large areas in the undeveloped sections where either a residential or industrial use may prove the more appropriate, depending largely on future port and terminal developments.

Height districts in five classes are provided, limiting the height of the building at the street line to a varying multiple of the street width. Back of the street wall the height of which is limited by a multiple of the street width, the building may go higher, but not beyond the line formed by the extension of a line drawn from the centre of the street to the limiting height of the street wall.

This will give a much greater freedom of building construction than a flat limitation of height. It will allow any height of building back of the street line that will not interfere with the required angle of light.

* * *

Area districts are in five classes which propose fixing varying percentages of lot that may be covered and corresponding regulations as to courts and yards. The 100 per cent. class is intended chiefly for warehouse, terminal and heavy manufacturing areas for which yard and court requirements would have no particular importance. In the 90 per cent. class buildings other than residential are permitted to cover 100 per cent. for the first two stories and 90 per cent. above. Resi-

dence buildings are, however, restricted to 70 per cent. as provided in the tenement house law.

A 70 per cent. class is intended for sections where the four-story apartment or flat seems an appropriate type. Higher buildings are discouraged by the provision that a five-story apartment may cover but 60 per cent. of the lot and a six-story apartment but 50 per cent. of the last. Even a 50 per cent. limitation will permit the erection of six-story model tenements of the type that has been used in a few instances in Brooklyn.

On business streets in the 70 per cent. class non-residential buildings will be permitted to cover 100 per cent. for the first story and 90 per cent. above the first story.

A 50 per cent. class is intended for sections where the one and two family house, either detached or in rows, seems the appropriate type. It is only applied to the more remote and less accessible areas. On the business streets of the 50 per cent. class, strictly non-residential buildings may occupy 100 per cent. for the first story and 70 per cent. above the first story.

A 30 per cent. class is suggested as appropriate for a few high class villa residence sec-

tions. It is understood to be practically optional; that is the commission will not be inclined to recommend it for any section unless at the request of substantially all the interested owners.

* * *

The Architectural League of New York this year is planning an innovation in the matter of architectural exhibitions. Recognizing the increasing interest in country houses and landscape architecture the Vanderbilt Gallery will be arranged as a formal garden, with plants and flowers, architectural details and sculpture. This will be so carefully arranged and so complete in its artistic effect that the officers of the league have decided to dispense with the annual dinner which, with its necessary tables and other paraphernalia, would injure the beauty of the scene. In place of the annual dinner the members of the league will organize a garden party, with an entertainment, "Souper a la Champetre," and dancing on the greensward. Appropriate music and rustic diversions will carry out the sylvan quality of the festival.

The league will on this occasion depart from its ordinary custom and extend the hospitality of the opening night to ladies.

TWELFTH ANNUAL CONVENTION OF THE AMERICAN CONCRETE INSTITUTE

The Board of Directors of the American Concrete Institute has provisionally established the following program for its twelfth annual convention on February 14 to 17, 1916, at the Auditorium Hotel, Chicago. This program has been prepared in such a way as to give the greatest possible freedom to members wishing to make a study of the exhibits in the Cement Show at the First Infantry Armory and Coliseum, and to attend the sessions of the Second National Conference on Concrete Road Building, which will meet at the Auditorium Hotel on February 15 to 18, 1916; the meetings of the Association of Municipal Building Inspectors at the same place, probably on February 14 and 15; and the meetings of the American Concrete Pipe Association, about the same date.

This combination of opportunities for inspection of exhibits, for attendance at gatherings of specialists, and for personal intercourse with a great number of men engaged in extending the use and improving the quality of concrete will prove of the highest importance. Everybody really interested in concrete will be repaid for attending the convention.

The program of the convention is unusually full, and some of the papers and committee reports relate to subjects on which there is a wide range of views at present. The same is true of the programs of other organizations meeting at the same time. It has seemed wise, in view of this prospect for unusual technical activity, not to set aside an evening for a

banquet, such as is often held by the Institute on such occasions, but instead to bring the convention to a close on the afternoon of Thursday, February 17th, and leave the evening free for an informal banquet if the members desire one after their professional work is finished.

PRELIMINARY PROGRAM.

Monday Morning, February 14.

Opening remarks of the President, Leonard C. Wason, President of the Aberthaw Construction Company, Boston.

"Concrete on the Massachusetts State Farm," Arthur J. Maynard, Superintendent of Construction, and Benjamin Baker.

"Relining the Winston Tunnel, Chicago Great Western Railroad," Harold P. Brown, Consulting Engineer, 120 Liberty street, New York.

"Swimming Pools," Edw. D. Boyer, Cement Expert, Atlas Portland Cement Company, New York.

"Durability of Concrete Pipe," J. H. Libberton, Assistant Engineer, Universal Portland Cement Company, Chicago, Ill.

"Novel Features of Concrete Work on the New York Subway," Robert Ridgway, Engineer of Subway Construction, and Ralph E. Goodwin, Junior Engineer, Public Service Commission, New York.

Report of Committee on Nomenclature, chairman, Frank C. Wight, managing editor, "Engineering News," New York.

Monday Evening, February 14.

"Cost Accounting on Concrete Work," Sanford E. Thompson, Newton Highlands, Mass.

"Operation of the New York Workmen's Compensation Law to Date," William C. Archer, Deputy Commissioner in charge of Bureau of Workmen's Compensation, State Industrial Commission, New York, N. Y.

"An Interpretation of the New Standard Contract Documents," H. L. Lewman, President, National Association of Builders' Exchanges, Louisville, Ky.

Report of Committee on Insurance, chairman, J. P. H. Perry, Contract Manager, Turner Construction Company, New York.

Report of Committee on Building Blocks and Cement Products, chairman, Robert F. Havlik, Moosehart, Ill.

Tuesday Morning, February 15.

Report of Committee on Reinforced Concrete and Building Laws, chairman, E. J. Moore, Chief Engineer, Turner Construction Company, New York.

"Requirements of Building Codes for Columns," P. P. Furber, Resident Engineer with C. A. P. Turner, Chicago.

"Design of Concrete Buildings," W. P. Anderson, President, Ferro-Concrete Construction Company, Cincinnati.

"Construction of Flat-Slab Floors." The details of this paper are in the hands of a special committee, which will announce the author later.

Tuesday Evening, February 15.

"Genesis of Reinforced Concrete Construction," Prof. W. K. Hatt, Purdue University, Lafayette, Ind.

"A Further Discussion of the Steel Stresses in Flat-Slab Floors," Prof. H. T. Eddy, 916 S. E. Sixth street, Minneapolis, Minn.

"Design of Foundations for Reinforced Concrete Buildings," Robert W. Boyd, Consulting Engineer, 105 West Fortieth street, New York.

Report of Committee on Fireproofing, chairman, Major John S. Sewell, Gantt's Quarry, Ala.

Report of Committee on Treatment of Concrete Surfaces, chairman, Cloyd M. Chapman, Engineer of Tests, Westinghouse, Church, Kerr & Co., New York.

Wednesday Morning, February 16.

"Tests Showing Continued Deformation under Constant Load," Prof. A. H. Fuller and Prof. C. C. More, University of Washington, Seattle.

"Influence of Temperature on the Strength of Concrete," Prof. A. B. McDaniel, University of Illinois, Urbana, Ill.

"Tests of Reinforced Concrete," Burtis S. Brown, Consulting Engineer, Boston, Mass.

Report of Committee on Reinforced Concrete Highway Bridges and Culverts, chairman, C. B. McCullough, Designing Engineer, Iowa Highway Commission, Ames.

Report of Committee on Sidewalks and Floors, chairman, Lewis R. Ferguson, Engineer, The Cement Association, Philadelphia.

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

Business affairs of American Concrete Institute.

Wednesday Afternoon, February 16.

"Difficult Foundation Work on the Bay of Fundy," N. M. Looney, Chief Engineer, American Can Co., New York.

"Forms for Concrete Work," R. A. Sherwin, Resident Engineer, Aberthow Construction Company, New Haven, Conn.

"Concrete Viaducts," Frank L. Raschig, Principal Assistant Engineer, Division of Structures, Department of Public Service, Cincinnati.

"Construction of the Large Concrete Viaducts on the Lackawanna R. R.," C. W. Simpson, Resident Engineer, Lackawanna R. R., Columbia, N. J.

"Tests of Large Concrete Slabs by U. S. Office of Public Roads and Rural Engineering," Earl B. Smith, Associate Mechanical Engineer, Office of Public Roads, Washington.

Report of Committee on Reinforced Concrete Chimneys, chairman, Harrison W. Latta, Engineer, The Cement Association, Philadelphia.

Wednesday Evening, February 16.

Report of Committee on Concrete Roads and Pavements, chairman, A. N. Johnson, Washington, D. C.

"Concrete Foundations for Pavements for Heavy Travel," Clifford Richardson, Consulting Engineer, New York.

"Essential Features for the Successful Construction of Concrete Highways," William M. Acheson, Division Engineer, State Highway Department, Syracuse, N. Y.

"The Construction of the Easton-Allentown Concrete Road," John T. Gephart, Jr., Division Engineer, State Highway Commission, Allentown, Pa.

"The Construction of the Toronto-Hamilton Highway by Day Labor," H. S. Van Acyoc, Chief Engineer, Toronto, Ont.

"The Construction of the Du Pont Concrete Boulevard," Charles Upham, Chief Engineer, Georgetown, Del.

"Special Features in Pavement," R. C. Stubbs, President R. C. Stubbs Company, Dallas, Texas.

Thursday Morning, February 17.

Report of Committee on Concrete Aggregates, chairman, Sanford E. Thompson, Newton Highlands, Mass.

"Tests of Concrete Materials at Cincinnati," Prof. G. M. Braune, University of Cincinnati.

"The Chemistry of Portland Cement," George A. Rankin, Geophysical Laboratory, Carnegie Institute, Washington.

"How Shall a Rational Specification for Gravel Concrete Be Developed?" C. C. Brown, editor "Municipal Engineering," Indianapolis, Ind.

"Tests of Sands at the Structural Materials Research Laboratory," Duff A. Abram, Instructor in charge of Laboratory, Armour Institute, Chicago, Ill.

Thursday Afternoon, February 17.

"The Design of Plain and Reinforced Concrete Sewers," W. W. Horner, Engineer in

Charge of Design of Sewerage and Paving, St. Louis, Mo.

"The Fall River Concrete Conduits," Frederick H. Fay, Consulting Engineer, Boston, Mass.

"Concrete Construction at the Kensico Dam," Wilson Fitch Smith, Division Engineer, Board of Water Supply, Valhalla, N. Y.

"Reconstruction of the Austin Dam," Lamar Lyndon, Consulting Engineer, New York, and Frank S. Taylor, Construction Engineer, Austin, Texas.

"Middleboro Water Tower," George Sampson, Consulting Engineer, Boston.

It is expected that a number of these papers will be printed for distribution before the Convention. Those expecting to take part in the discussion of any paper or report should make that fact known to the Institute at an early date, in order that a copy of the paper or report may be sent to him as soon as it is in type, providing preprinting is practicable.

Members and guests desiring accommodations in the Auditorium Hotel should make their arrangements with its manager, stating that they will attend the Convention of the Institute.

AMERICAN CONCRETE INSTITUTE,
1418 Walnut street, Philadelphia.

ART MUSEUM PLANS NOT A NOVELTY

Drawings and Sketches to the Number of Six Dozen Submitted for the Projected Museum now Shown in Model at the Philadelphia City Hall.

Some of the citizens who hopefully view the model of the proposed Art Museum, on exhibit in the City Hall courtyard, may recall the long-continued promotion of this project that, up to its present initial stage of construction, has cost the city almost a quarter of a million dollars in grading and preparing the site, in paying architects' commissions and in meeting the carrying charges on the bonds floated for the Museum. A full quarter of a century has elapsed since the project received its first big impetus in a movement started by a group of wealthy Philadelphians desirous of having the city provide a suitable and safe gallery for the storage of such collections of paintings and sculpture as it might acquire.

As a result, up to the present time, more than six dozen plans, drawings and sketches for a Municipal Art Museum have been submitted. Nearly fifty thousand dollars has been expended in payment of architects' commissions, although largely for the preparation of what can be called barely more than "tentative" or "preliminary plans." The first and largest group of plans for the Museum was submitted twenty years ago in a prize competition for which Councils appropriated fifteen thousand dollars. At that date it was proposed to place the Museum on Lemon Hill, and all the designs submitted,

sixty-seven in number, were drawn for that site, although some were capable of being adapted to any plot of ground of the required dimensions.

These plans were considered by a notable jury, appointed by the Commissioners of Fairmount Park, the jurors being Professor William R. Ware, of Columbia College; Stanford White, of New York; Daniel H. Burnham, of Chicago, who had recently won great fame as the planner of the Chicago World's Fair; John G. Johnson, Esq., and Joseph M. Wilson, of this city. Over one hundred sketches were embodied in the submissions, some of which outlined elaborate, striking and noble structures of great cost and beauty. The contestants, after the custom of such contests, had signed their drawings with odd titles to conceal their identity from the jurors, who finally selected eight plans as the most meritorious, the winners bearing the titles Keystone, Acropolis, Black Seal, Nike, Maltese Cross, Quantum Meruit, Phi and Proportion. Out of that number, however, but the first three were awarded prizes, an award of six thousand dollars going to Henry Bacon and James Brite, of New York, a three thousand dollar prize being given to Lord, Hewlett and Hull, of New York, and two thousand dollars being awarded to Marcel Perouse de Monchos, of Paris, the originator of one of the most elab-

orate plans. The design awarded the first prize called for a classic structure, rectangular in shape, and covering a site six hundred and twelve feet long and two hundred and seventy-five feet wide.

But all these plans came to naught. Other sites were proposed. Advocates appeared for sites nearer the Girard avenue entrance to the Park. The active promotion of the Parkway produced some who suggested the north side of Arch street, between Fifteenth and Sixteenth streets, as the proper location, and, early in the history of the Parkway, some local architects, who foresaw the advantages of the "Acropolis" provided by Fairmount Hill, pictured the possibilities of the present accepted site. The "prize plans," therefore, were soon discarded and now rest, almost forgotten, in the basement of the City Hall.

Although the city talked at that time of erecting a six-million-dollar museum, it was not until three years later that Councils, in response to an offer of the Board of City Trusts to donate the Benjamin Franklin Fund of \$158,000 on condition of the city's contribution of a like amount, caused the insertion in one of the loan bills of 1898 of an item of two hundred thousand dollars for an art museum. But one can go even farther back for Councilmanic approval of the project, as in 1871, anticipating the coming Centennial and desirous of providing a safe storage place for some of the city's paintings, Councils passed a resolution calling on the Commissioners of Fairmount Park to suggest a Park site for an art gallery.

The authorization in the loan bill of 1898 was not utilized, however, and because of the city's inaction the Board of City Trusts finally withdrew its offer of the Franklin Fund. Meanwhile the suggestion had been made to extend Memorial Hall by the addition of wings, and steps were taken toward securing plans and estimates for that project. But that also fell through, and the Art Museum loan item remained unnegotiated until near the close of the Reyburn administration, when the progress of the Parkway and the renewed interest in the city beautiful led to the preparation of plans and models for the Museum, in which work William E. Groben, of the Survey Bureau; Professor Paul P. Cret, of the University of Pennsylvania's School of Architecture, and other architects, including Messrs. Zantzinger and Borie, two of the designers of the present model, were interested.

It was not until little more than two years ago that the project reached the stage of actual construction, when the loan fund was transferred to the Park Commission, contracts awarded for grading the site, and a preliminary plan and study of a Museum submitted by Messrs. Trumbauer, Zantzinger and Borie was sent to the Art Jury for consideration, the architects then receiving a fee of thirty-six thousand dollars for their services. Subsequently the "1913 model" of the Art Museum was withdrawn for further revision and the present model, the result of new studies, is now announced as final. With the available loan fund of eight hundred thousand

dollars and the possible inclusion of an item of three million dollars in the next big municipal loan, it is said, if work is started this year, the Museum can be completed by 1918. But if, by any mischance, further delay should ensue, the city will soon be able to liken its frequent preparation of Art Museum plans to the fashion of the automobile trade and prepare itself to receive in time a "1917 model" to displace its latest design.—"Evening Bulletin."

COMPULSORY SEGREGATION.

Compulsory segregation of the negro through separating his home from that of the white man has recently, as a legislative idea, spread among the Southern cities. Is it sociologically expedient, and is it legal?

Such segregation ordinances are in effect in Baltimore, Louisville, Richmond, Norfolk, Greenville, S. C., and other cities, and some of these have been upheld in local State courts. The Atlanta ordinance of 1913, under which two proceedings had been instituted by negroes to exclude undesirable white neighbors, was obviously drastic in form; it was judicially condemned in February, 1915. The Louisville ordinance makes it unlawful for a person of one color, over formal neighborhood protest in a certain form, to move into a house in any block in which a majority of houses are occupied by persons of the other color.

With respect to vacant blocks, the owners of over 50 per cent. of the frontage may exclude one color or the other.

PREDICTS GOOD ELECTRICAL YEAR.

Frederick M. Shepard, president of Cates & Shepard, electrical and mechanical constructing engineers of this city, and head of the Jovian Electric League, said recently that prospects point to the coming twelve months as being the most prosperous the electrical industry will have experienced in its history in this city. The firm of which he is head has closed contracts for \$50,000 worth of electrical construction work this week.

Among the contracts, which include the erection of engines, generators, motors, etc., were the following: Schmidt Building, 327 Arch street; manufacturing building for Bennett & Aspden Company, upholstery manufacturers, Krams avenue and Pechin street, Manayunk; settlement music school building, Fourth and Queen streets, for Mary Louise Bach; manufacturing building for the Vim Motor Company, Twenty-third and Arch streets, and the John B. Stetson public school, B street and Allegheny avenue.

STATE LUMBERMEN TO CONVENE IN CITY.

Lumbermen from the eastern part of the State are in Philadelphia this week to attend the annual convention of the Pennsylvania Lumbermen's Association, the retailers' organization, to be held in the Hotel Walton January 26 and 27. The morning of the opening day will be devoted to committee meetings, followed by routine business in the afternoon. In the evening there will be an entertainment furnished at the Hotel Adelphia by the Philadelphia Wholesale Lumber Dealers' Association whose committee is made up of J. Randall Williams, Jr., Harry G. Parker, Thomas B. Rutter, Jr., Ben C. Currie and John I. Coulbourne. Thursday morning there will be an open meeting for the presentation of addresses followed by discussion.

The annual dinner of the association will

be served at 1 o'clock on Thursday. This will conclude the convention, but another event has been arranged for the evening, when the Lumbermen's Club, composed entirely of lumber salesmen, of which there are 48 members enrolled, will hold a "get-together" at the roof garden of the Adelphia.

Reports from the eastern counties of the State say business is good, and so reflect conditions in this city, which are described thus in an official publication:

"The mills in the manufacturing sections cannot get all of their lumber carried to points of consumption. Retailers who have stocks in their yards are in a jubilant frame of mind. Others who have stocks ordered are hopeful that freight congestion will be relieved and that they will have a chance to sell while prices are on the upward trend. But the retailer who failed to gauge the needs of his patrons is in a sorry fix, as wholesalers positively refuse to take orders from new customers in these boom times.

Yellow pine and North Carolina pine are still jumping in price and will no doubt go beyond the records established in 1907, before the spring building activity gets under way. The hardwoods are scarce and firm, with many items going upward. Shingles are selling in large volume, while lath is extremely hard to get. Prosperity has been a long time arriving, but every wholesaler, manufacturer, millman, planing mill proprietor and retailer in this city and vicinity is making money just now, the total of profits being in accordance with the amount of lumber on hand for sale. And what adds to the joy is the spirit of confidence that the rush of business is going to continue throughout 1916 whether the European war ends or goes on."

MORTGAGE MONEY.

Money is now coming out in both large and small sums for long-term mortgage loans (three to five years), whereas some months ago would accept only short-term notes. Moreover, so plentiful is the money now available that it can be had oftentimes for well secured loans for 4½ instead of 5 per cent. interest. Vacancies in the midtown business places north of Twenty-third street, and in the residential sections of the West End and Washington Heights have become rare exceptions. There's the money to build with and there also is the demand for more construction.—"New York Real Estate Record."

BUILDINGS OVERMETALLED.

A twelve-story apartment house one hundred feet square requires ten or eleven hundred tons of structural steel in its structure, and a twenty-story office building of the same ground dimensions about twice as much. A tax of 25 cents a ton on fabricated iron and steel would amount to about \$250 increased cost in the one case and \$500 or thereabouts in the other. Architects could save most of it by reducing the weight of the members, as most buildings are more or less overmetalled.—"Real Estate Record."

PREVENTION OF FIRE COMMITTEE MEETS.

The first conference of the Advisory Committee that is working with the State Department of Labor and Industry in studying methods of preventing fires, was held January 18 at the Engineers' Club.

The time was devoted to discussion of reports made upon statutes and ordinances in the various States designed to prevent fires, and upon an interpretation of existing laws in this State covering the same purpose. Frank B. Cliff, an advanced student of Wharton School, University of Pennsylvania, who compiled a report and analysis of these various acts, submitted his report.

He collected his data not only from law reports, but from reports in general, handbooks, pamphlets and publications made by various organizations and institutions. From this matter he classified various standards and submitted them for consideration.

Shippen Lewis, a lawyer of this city, who interpreted existing laws in this State, also was present. His interpretation outlined the points covered by Pennsylvania acts and points still to be covered. The purpose of the meeting was to thoroughly discuss these reports before adopting standards that will be used in the committee's survey of factories and other buildings.

ELECTRICITY AND TREES.

It is a fact worth noting that when an arc light is placed in such a way that a tree will be under its rays all night, the tree inevitably loses its virility and dies. We do not remember having seen this matter discussed, but observation through many years proves it to be true.

Just what the cause is, we are unable to say, unless it lies in the fact that trees, to grow and thrive, must have a certain number of hours' darkness out of each twenty-four. The laws of nature are exactly and evenly balanced. It has been proven that a human being grows only in the daytime, and that trees grow only at night.

In placing arc lights they should always be set as far as possible from trees which the owners desire to preserve. Another argument against placing lights near trees is that the lights attract to that immediate vicinity every specie of bug and fly, and when daylight comes they take refuge in the branches of the tree to deposit their eggs and prey on the vitality of the tree.—"Southwestern Electrician," Houston, Texas.

BIG ELECTRICAL BUSINESS.

As indicative of the enormous demand for electrical equipment and the heavy contracts booked by the large manufacturing companies, an order amounting to \$150,000 for a turbine and accessory equipment from one of the largest corporations in the country has gone begging because delivery could not be made inside of ten months, which would have meant that the machinery would not be in operation much before the end of 1916.

TRADE **ECONO** MARK
EXPANDED METAL

"ECONO" expanded metal is furnished in meshes like the one illustrated above for reinforcing concrete floors and roofs, sewers, bridges, bridge floors, culverts, conduits, tanks, etc.

The meshes for this purpose are 3 and 2 1/4 inches wide. We are also in position to furnish a special mesh 5 1/4 inches by 12 inches for use in reinforcing concrete roads and pavements.

"ECONO" expanded metal is furnished in 1/2, 3/4 and 1 1/2 inch meshes for use as machine guards, screens, etc.

The 1 1/2 inch mesh is frequently used for partitioning off a portion of floor space for use as stock or tool rooms. It makes a solid partition but at the same time does not obstruct the passage of light and air.

WE CARRY A COMPLETE LINE OF ALL KINDS OF EXPANDED METAL

A COMPOUND OF LEATHER

A Superior Sanitary Flooring

The highest degree of efficiency in composition flooring has been obtained in Leatherfloor. It is fire-proof, water-proof, dust-proof, germ and vermin-proof, noiseless, non-slipping, flexible, elastic and inexpensive.

Leatherfloor is admirably adapted for floors, base and wainscoting, in Hospitals, Asylums, Schools, Churches, Libraries, Theatres, Hotels, Restaurants, Apartment Houses, Factories, Stores, Banks, Steamships, Yachts, Railroad Cars. Etc., wherever a smooth, sanitary, fire and water-proof flooring is desired.

Leatherfloor is the Best
Leather Flooring Co.

Liquid Filler

The first Liquid Filler made and the best, answering every requirement of Nice Standard.

Wood Fillers are the trade's stand-bys. You can shoot at them from any standpoint without making any impression.

They are economical in time, labor, material; and produce wonderful results. In addition they are indispensable to every painter and finisher because of their adaptability to other uses.

A postal will bring you samples and catalogue free.

Satisfying THE BUILDER THE ARCHITECT THE OWNER

No house is more satisfactory than its sanitary fixtures. On this detail depends the comfort and convenience of the "owner"—the success of the "architect" and "builder."

"Fleck Fixtures", backed by an ironclad guarantee, known for their durability and specified as the best to be procured, will give that "individuality" so requisite in a "home."

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation.

Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases.

Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

Write for Booklet.

Barrett Specification Roofs and the General Electric Company

THE chain of huge and handsome buildings, shown below, is set in the midst of twenty-seven acres of broad lawns and trees and looks more like a university than a business establishment.

It is, however, Nela Park, the site of the National Lamp Works of General Electric Company. Its product is the famous National Mazda Lamp. Undoubtedly it is the handsomest commercial establishment in America, perfect in every detail, including the roofs, for every one of the great buildings is covered with a Barrett Specification Roof.

These roofs were chosen because

- they will give greater service at lower cost than any other permanent roofing.
- they require no painting, coating or attention of any kind.

—they will give perfect protection for upwards of twenty years.

—they are accorded the base rate of insurance and are approved by the Underwriters' Laboratories.

Special Note

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding.

If any abbreviated form is desired, however, the following is suggested:

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed Specification, revised August 15, 1911, using the materials specified and subject to the inspection requirement.

A copy of the Barrett Specification, with roofing diagrams, free on request.

"Evans" Almetl Fire Doors (and Shutters)

FULLY APPROVED BY THE UNDERWRITERS' LABORATORIES, INC.

To Architects, Builders and Contractors:

The "EVANS" ALMETL Fire Door is offered as a marked improvement on the standard tin-clad door now in general use. In its tests at the UNDERWRITERS' LABORATORIES by the National Board of Fire Underwriters, it demonstrated its superiority in many respects.

The tin-clad wooden door has served thus far as the only door obtainable in its class, but its limitations have been recognized. Lacking in durability at its best, it is bound to give place to a light-weight, indestructible, all-steel door such as we now offer.

The "EVANS" ALMETL Fire Door is erected by experienced metal contractors everywhere. Write to us direct for detailed information.

Koelle, Clarence C. Zantzing.

Editorial Comment

In his address before the forty-ninth annual convention of the American Institute of Architects, in Washington, recently, R. Clipston Sturgis, president of the Institute, commented strongly upon the necessity which exists for a better understanding as between the great outside public and the men who practice architecture. It is a fact capable of easy proof that while the great masses of the people know something of the arts of painting, of sculpture, of music and of literature, they know little or nothing of the art of architecture.

Mr. Sturgis said in part:

"The first need then in all our efforts toward co-operation, whether it be establishing the standards of our own members, or improving the housing conditions of workmen, or arousing the interest of the public in what is good and true and beautiful—the first need is sympathetic understanding. We cannot enforce standards of practice without knowledge of the special difficulties in some cases, and how much harder it is for some than for others. It is easy for the busy, prosperous or financially independent architect to refrain from drumming up work, and not at all difficult for him to view with scorn and contempt the man who scrambles for it. It is quite a different thing for the man whose office is idle, whose pocket is empty, and whose children need food and clothing and education.

"We cannot arouse the public to interest in our own life work—studying conditions, solving problems with sound common sense, and then adding, with creative imagination, the beauty which is the vital element of it all, unless they see our point of view and know it is disinterested. The crying need of the Institute is for a better understanding on the part of the public, and a fuller recognition of the profession and what it stands for. This can be accomplished only by a high stand on the part of every architect, and a keen sense of his own responsibility for the attitude of the public."

* * *

Here in Philadelphia a conference was held recently at which were present a number of city officials and a group of the city's leading architects. The subject that called them together was the consideration of plans to make Philadelphia a more beautiful city. There was an interesting exchange of ideas and a discussion that brought out a number of valuable suggestions for the future development of the city. Two of the suggestions offered were of special interest. One,—advanced by Mr. D. Knickerbacker Boyd,—which advocated the appointment by the American Institute of Architects of a committee to instruct the public on matters pertaining to building construction, and another,—advanced by Mr. Albert Kelsey,—who introduced the novel and

entirely practicable idea of making each of the city's public schools in its way a little civic centre.

"I should like to see this sentence placarded and distributed for public enlightenment as a sign of the times: 'The recollection of the quality will remain long after the price is forgotten,'" said Mr. Boyd. "I have suggested to the American Institute of Architects that a committee should be appointed to instruct the public on matters pertaining to building construction, so that the general level of the public conscience be elevated. I believe the result would be a demand for a higher standard of design and a better type of construction.

"A most important matter in line with the preservation of our historic edifices is that sufficient space shall be acquired around them to prevent them from becoming a prey to conflagrations. These open spaces also will provide an appropriate setting for our relics of priceless value.

"Properties adjoining old Christ Church and Carpenter's Hall have been secured for this purpose.

"Emphatic protest must also be made against the use of any combustible material whatever in the construction of school houses. The curtailment of the enormous losses which the cities of our country have sustained in general will not be accomplished until the subject of fire prevention has received the same consideration by the general public as has been given to the stamping out of contagious diseases.

"Americans are wasteful. We pay thousands of dollars for a given area of the city and then wantonly neglect the use of our roofs. A parapet around a roof will allow of its use for many purposes. We should have them more like those in warmer climates, enclosed with parapet walls. Moreover, they should be of fireproof construction. The utter disregard now shown for appearance in the erection of water tanks, steel chimneys and other etceteras is to be deplored, and these bad features should be corrected.

"In these and many other matters concerning the aesthetic side of city development, we must all lift our eyes and develop the powers of observation. Too many of us live with our eyes close to the ground and lose our sense of proportion and see things in a wrong perspective. Every citizen should make it a point to see and know his city better by ascending a height and studying the layout of buildings, streets and open spaces. The ability properly to study the conditions of our slums and alleys from above will give a much more comprehensive idea than can be gotten merely in passing by on the other side."

* * *

"For twenty years or more I have made a

study of city making," said Mr. Kelsey. "As long ago as the year 1897 I was sent abroad by the University of Pennsylvania to make a special study of this nature, and some years later was made chief of the division of municipal improvements at the Louisiana Purchase Exposition, and created the model city, which was the first city planning exhibit ever held in the United States. I merely mention these facts to show that I have been keeping in touch with such movements, but, after all is said, I have been forced to the conclusion that it is education alone which will solve the problem of 'The City Beautiful.'

"It is always a compromise between expediency and the best way to do it. Of course, under an ever changing form of civic government it is very difficult to obtain any continuity of effort; in consequence, if the people are opposed to a commission form of government, or to placing such far-reaching propositions in the hands of a self-perpetuating commission, as Boston and her tributary communities have developed, then we must do the best we can under existing conditions.

"It is my firm conviction that the one thing to do is to look to the public schools for our means of regeneration. We have them in every ward and in every quarter of the city. Use the present system of public education as a basis for a gradual metamorphosis of the entire city. Make every school building a little oasis about which adjoining property must improve. In other words, make every new school house a social centre; place it in a small park which shall be a breathing spot for the benefit of the grown-ups, as well as a recreation for children. Around each of these centres establish a new system of building laws, and in the outlying and open sections widen out certain arteries of traffic radiating from these points out into the distant country.

"Have at least one tree-lined avenue starting from each of these new centres, and thus gradually broaden the streets, and a greener city will tend to break the terrible monotony and growing congestion which now prevail.

"I realize that this is not entirely practicable, but if every school centre should be made a point from which every one in the neighborhood would learn to expect some kind of civic improvement, a great deal could be done in a few years to educate our people in all walks of life and in all sections of the municipality."

* * *

Mr. John T. Windrim remarked, as the chief need for the city's growth, the co-operation of architects with vision.

"The work of the architect is necessary if the City Best to Work and Live In is to be an actuality and not merely a dream, as the fundamentals of his education fit him better than any other thinking man to understand what is required to make a great city as well as a useful one," said Mr. Windrim.

"A truly great city is one in which it is healthful to live and where its streets, avenues and approaches give the speediest and safest facilities in getting from one point to

another. An ugly city would not be a healthful place in which to reside, for above all things, we must have color, sunshine and broad spaces with nature given a full chance.

"Philadelphia has the greatest opportunity of any of the old cities to become one of the most beautiful in the world. Take that section below South street, from river to river. It is absolutely virgin ground. It should be laid with diagonals and approaches and could be reclaimed and built within a mile of the heart of the city. Our proposition is not that of London, where it cost \$50,000,000 of then existing values to construct the King's Way.

"Mayor McClellan, I believe, is more responsible for the utilitarian and impressively magnificent appearance of New York City than any other single individual. Who his contractors were did not matter, provided they had capable and effective organizations; but he insisted on the known capability of the architects.

"Such confidence in the worth of the competent architect is well placed, and a good example of the result of intelligent study of men of thought on a completely rendered subject is the Grand Central Station.

"In many buildings we can see a lack of proportion which has been covered by meaningless ornamentation. Therefore, the business of the architect is to inspire dignity, efficiency and simplicity, as the safety and happiness of the public depend largely on the thoughtfulness given to his subject.

"Then, again, the question of ventilation, heating and lighting is under his jurisdiction, and the designer of buildings must necessarily inspire the work of the landscape architect. Inspiration and vision play a most important part in his work and one of the ways in which this is secured is by travel and seeing other cities and observing methods and motives.

"There is not a doubt that we have many sore spots in our city; these should be opened up by widening the avenues, but it is a mistake to move any industry from one part of the city to the other merely to get away from surrounding conditions which are not harmonious, and it is the real duty of the people who control events to stop the movements of centres, as values cannot be conserved in that way.

"Every effort should be made by the powers of government to prevent a changing or lessening of realty values by important industries moving from one neighborhood to another. The important industries should remain where they are, and the lesser things that are crowding them be removed.

"Take an important industry of any nature and let it be a point of radiation; it will stay if freed from congestion, made quick of approach and easy of access."

* * *

Mr. Horace Wells Sellers, President of Philadelphia Chapter of the American Institute of Architects, described the greatest obstacle to development of the city along artistic lines the difficulty of trying to make the layman

realize the possibilities and natural advantages enjoyed by this city of homes.

"Our chapter of the American Institute of Architects is so impressed with these great questions of civic betterment and of the necessity of trying to make the layman realize the great possibilities and natural advantages possessed by this city of ours, that we have arranged a talk for this purpose on the 26th of the month," said Mr. Sellers, "when we expect to discuss the subject and try to lend our assistance in obtaining a better Philadelphia.

"We architects look upon questions of utility, broad spaces and light and air as of prime importance, after which comes the question of embellishment, and both the Institute and our own chapter at all times stand ready to give advice on matters pertaining to municipal improvements and gratuitous public service in restoring public buildings or places of historic interest.

"There is a very serious fault in our American cities, and that is, their growth is left to chance. We allow manufacturing plants to crowd residential quarters. They start at water fronts and the manufacturing quarters and business sections encroach on the residential zones and frequently disfigure the city.

"Speaking of zones makes me feel that by such a system, a beautiful city is made possible if capital will improve its own property. The hope is in the new sections. In laying out a suburb or part of a city, the zone system contemplates nothing but first-class residences in one section, in another factories and adjacent to that employees' houses, but it takes a dictator to do this.

"Limit the height of buildings. That is what makes Paris so beautiful and it is an admirable example of what can be done by restriction. This gives light and air, which are vital elements.

"A certain blight to our city is the pressing out into the suburbs of these rows of small houses and putting the greatest number of them on a given tract of ground, with no regard to beauty, light and air.

"If we would take the old market at Second and Pine streets and restore it to its original condition and then park the rest of the way, it would help things in that quarter. There is a great deal to be said in favor of setting standards, as a feeling of pride and competition enters into the proposition and there is an incentive to follow after the standard which has been set up."

* * *

Mr. George Spencer Morris, of Morris & Erskine, remarked:

"The things which I feel would be of the greatest benefit toward improving our city and making it a more desirable place to live in may be considered by many as being of minor importance. Projects like the Parkway, the Art Museum and beautifying the rivers will undoubtedly come in the course of events, and will be handled by competent engineers and architects; but when we think of the vast number of houses which are being

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

built in all parts of the city, principally the newer districts, without any regard to beauty or architectural design, we cannot help but regret their deadly uninterestingness.

"Many builders imagine they are producing 'something new' when they introduce an odd gas fixture or put colored glass in the vestibule.

"Out on the Northeast Boulevard I noticed an encouraging indication of a builder moving in the right direction. He offered a prize of \$500 for the best design for a dwelling house. As a result, they show the effect of careful planning, as they are much more picturesque and attractive than many of those about them.

"The houses on the Girard Estate in the lower part of the city are also good examples of the exercise of care and forethought, coupled with artistic appreciation.

"Much could be done by the improvement of back yards, especially in the older part of the city. They could be opened up, not necessarily for public use, fences removed or lowered and pergolas and arbors erected. All these things have been done and can be done again.

"There are also many places and odd nooks and corners in our city which could be cleaned up and made into very desirable residences, offices and studios. Take, for instance, Camac street. A few years ago it was the haunt of the vicious, and one's life was hardly safe there. Now it is filled with a number of attractive club houses. Ludlow, Cherry and Commerce streets are full of such places. What we must do is to get away from the dead monotony of commonplaceness."

* * *

There were a number of other entertaining and instructive suggestions, more in fact than we can find space for in one reference to the

subject. The point we wish to establish in quoting them here at this time is to demonstrate to Mr. Sturgis that here in Philadelphia the architect is already busy with the great task of educating the lay public. Philadelphia Chapter has had a number of notable meetings along this line and expects to hold many more, the chief purpose of which is to make plain through the co-operation of the

press and public officials the importance to a city of good architecture.

It seems to "The Guide" that the idea here embodied is one that might profitably be taken up by Chapters of the Institute elsewhere, to the end that the masses of the people may be aroused to the importance of the little-understood but vitally important art of community planning.

MARYLAND Construction News

Sunday School Building, Baltimore, Md. Architect, T. W. Pietsch, American Building, Baltimore, Md. Owners, Calvary M. E. Church, Baltimore, Md. Brick and marble trimmings, 1 story, 68x70 feet, slag roof, steam heating, electric lighting, dampproofing, metal lath. Architect has received bids.

Pier Superstructure, Baltimore, Md. Engineer, private plans. Owners, The Canton Co., Commerce and Water streets, Baltimore, Md. Steel and corrugated iron, 250x70 feet, steel sash, steel rolling doors. Owners taking bids, due February 4th. Irwin & Leighton, 126 North Twelfth street, Philadelphia, are figuring.

Office Building, Baltimore, Md., \$100,000. Architect, Louis Levi, Real Estate Trust Building, Philadelphia. Owners, Sun Life Insurance Co., 900 North Eutaw street, Baltimore, Md. Granite base, brick, terra cotta and steel, fireproof, 4 stories, 64x74 feet, steam heating, composition roof, electric lighting, elevator, marble and tile work. Plans about completed. Architect will take bids in about two weeks.

Garage, Baltimore, Md. Architect, Clyde N. Friz, Munsey Building, Baltimore, Md. Owners, Mid-City Garage Co., Baltimore, Md. Brick, concrete and steel, fireproof, 3 stories, 85x185 feet, slag roof, steam heating, electric lighting, elevator. Architect has received bids.

Dwelling (alts.), 14 St. Paul street, Baltimore. Architect, F. E. Beall, 306 St. Paul street, Baltimore. Owner, H. M. Burkett, 307 St. Paul street, Baltimore. Brick, 3 stories, consists of interior alterations from dwelling to offices. Plans in progress.

Dwelling, Old Harford Road, Hamilton, Md., \$2,200. Architect, G. Bernard Lohmiller, 1735 North Broadway, Baltimore, Md. Owners, Lohmiller Building Co., 1735 North Broadway, Baltimore. Frame, 28x30 feet, slate and asbestos shingle roof, 2 stories and 1½ stories, weatherboard and stucco, porches, steam heating, electric lighting. Plans in progress.

Cottage, North Road, near Cedar Road, Baltimore, \$3,000. Architect, George R. Morris, Gunther Building, Baltimore. Owners, Northwestern Real Estate Co., 45-46 Gunther Building. Frame, 1½ stories, steam heating, electric lighting. Architect will take sub-bids.

Residence, St. Paul street and University Parkway, Baltimore, \$35,000. Architect, Geo. R. Callis, Jr., 55 Knickerbocker Building, Baltimore. Owner, Mrs. Mary Kennedy, Baltimore. Brick, 2½ stories, 65x50 feet. Plans in progress.

Hotel, Blue Mountain, Md., \$250,000. Architect, not yet selected. Owners, Blue Mountain Hotel Co., care of John Gibbons, manager, care of Western Maryland Railroad, Baltimore. Fireproof, 4 stories, to contain 250 rooms, 100 private bath rooms, stone, electric

lighting, electric elevators, mechanical heaters and filters.

Hotel, Light and German streets, Baltimore, \$500,000. Architect, Otto G. Simonson, Maryland Casualty Building, Baltimore. Owner, The Southern Hotel Co., Calvert Building, Baltimore. Brick and steel, 10 stories, basement and sub-basement, promenade tile roof, steam heating, electric lighting, power plant, granolithic sidewalks and vault lights, electric elevators. Plans in progress. Will be ready for bids about April 1st.

Y. W. C. A., Clinton street, near Eastern avenue, Baltimore, \$40,000. Architect, O. B. Wright, 1122 Munsey Building, Baltimore. Owners, Highlandtown Branch of Y. M. C. A. Steel and concrete. Main building, 3 stories, 62x40 feet; gymnasium annex, 2 stories, 48x72 feet, concrete and wood floors, gas and electric lighting. Architect taking bids. The following are figuring: B. F. Bennett Building Co., 23 South Howard street; John Cowan, Inc., 106 West Madison street; Fred Decker & Sons, 1209 East Biddle street; J. H. Miller, Inc., Miller Building, Franklin and Eutaw streets; Morrow Bros., Fidelity Building; C. E. Stubbs, 458 Equitable Building; C. E. Stockhausen Co., Inc., National Marine Bank Building; John Waters, 23 East Center street; C. W. Littleton & Son, 5313 Liberty Heights avenue; Cogwell-Koether Co., 206 Park avenue, all of Baltimore.

Sunday School Building, University Parkway and Charles street, Baltimore, \$35,000. Architect, Theodore Wells Pietsch, American Building, Baltimore. Owners, Methodist Calvary Episcopal Church South, Baltimore. Brick, marble trimmings, 1½ stories and basement, steam heating, slag roof, gas and electric lighting, plumbing. Architect taking bids, due February 10th. The following are figuring: B. F. Bennett Building Co., 123 South Howard street; Irwin & Leighton, Keysey Building; D. M. Andrews Cont. Co., Equitable Building; Edward Watters & Co., 509 North Charles street; C. C. Watts, 407 East Twenty-fifth street; Burns & Russell, 1103-04 American Building; Consolidated Eng. Co., 243 Calvert Building; C. E. Stubbs, Equitable Building; John Hiltz & Sons, 3 Clay street; Singer-Pentz Co., Equitable Building; Fred Decker & Son, 1209 East Biddle street; Cogwell-Koether Co., 206 Park avenue; West Construction Co., Knickerbocker Building; Geo. M. Blacke, 332 Law Building; Henry Rippel, 7 Clay street, all of Baltimore.

Read "The Guide." Read it all through. Don't let a single item escape your notice. You'll be surprised what a lot of valuable information is crowded into its pages in the course of a year.

White, treasurer, from their respective offices, and the election of Harry C. Trexler, president; E. M. Young, vice-president, and Alonzo F. Walter, treasurer.

****AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS**, at its annual meeting, will elect its officers for the year. The nominating committee has prepared a slate as follows: For president, Harry M. Hart, Chicago; for first vice-president, Frank T. Chapman, New York; for second vice-president, Arthur K. Ohmes, New York; for treasurer, Homer Addams, New York. For members of the council: D. D. Kimball, New York; Henry C. Meyer, Jr., New York; Dr. E. V. Hill, Chicago; Frank Irving Cooper, Boston; Walter S. Timmis, New York; Charles R. Bishop, North Tonawanda, N. Y.; Fred R. Still, Detroit, and M. W. Franklin, East

****ROY E. GUARD**, architect, has moved his offices from the Masonic Building to the Baker Block, North Broad street, Norwich, N. Y.

****J. L. SCHMIEDEICKE**, heating and plumbing contractor, 1001 Seneca avenue,

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 27, 1916.—Sealed proposals will be opened in this office at 3 P. M. February 17, 1916, for the construction of an extension to the power house in connection with the Experiment Station, Bureau of Mines, at Pittsburgh, Pa. Drawings and specifications may be obtained from the superintendent of construction, 4902 Forbes street, Pittsburgh, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 25, 1916.—Sealed proposals will be opened in this office at 3 P. M., March 7, 1916, for the construction complete (including mechanical equipment and approaches) of the United States post office at South Bethlehem, Pa. Drawings and specifications may be obtained from the custodian of site at South Bethlehem, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 31, 1916.—Sealed proposals will be opened in this office at 3 P. M., February 29, 1916, for alterations to the United States post office and courthouse at Martinsburg, W. Va. Drawings and specifications may be obtained from the custodian at Martinsburg, W. Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

UNION METAL COLUMNS

"The Ones That Last a Lifetime"

These columns are made with shafts of open hearth steel formed in correct architectural proportions by means of special dies and machinery.

FOR PORCHES, PERGOLAS, INTERIORS

They will not split, check, rot or open at the joints as wood columns are certain to do sooner or later.

Protect the appearance of your work by using and specifying Union Metal Columns.

P. O. SPECIAL Expanded Metal Plastering Lath

ACTUAL SIZE OF MESH

P. O. Special metal lath is a heavy weight expanded metal lath designed for use wherever the regular types will not meet the specifications.

The mesh is about twice the size of "Kno-Burn" metal lath and the strands are 3/32" wide.

This type of lath is manufactured only from 22 guage metal and may be secured either with a finish of high grade paint or galvanized.

The sheets are 18"x96", the size which has been found by lathers to be the most convenient to handle on the job.

This is only one of the types of metal lath sold by us. Let us quote you on the lath you will need for that new job.

The Standard Documents of the American Institute of Architects

The New Contract Documents of the American Institute of Architects are now on sale and replace the old Uniform Contract, which is to be discontinued

PRICES FOR SINGLE COPIES

Agreement and General Conditions in cover	\$.10
Bond of Suretyship	.02
Form of Subcontract	.02
Letter of Acceptance of Subcontractor's Proposal	.01
Complete set in cover	.15

Trial set delivered upon receipt of nine 2-cent stamps.

These Documents have received the full approval of the Institute, through its Convention, Board of Directors and Officers. They are the outcome of nine years of continuous work by a Standing Committee on Contracts and Specifications. This Committee, comprising some of the ablest American architects, was assisted by the Institute's forty Chapters; advised by eminent legal specialists in contract law and aided by representatives of the Building Trade Associations of the United States. The forms have been officially approved by the National Association of Builders' Exchanges, the National Association of Master Plumbers, and the National Association of Steam and Hot Water Fitters.

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation.

Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases.

Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

Write for Booklet.

There never was, never will be, a better medium for the man who has something to sell to a given class of buyers than the trade paper whose circulation is limited to that class. Newspapers with their swollen circulations strike at best but a chance target here and there. The trade paper carries your rifle fire to targets exclusively. You can't miss,—if your ammunition's right.

Editorial Comment

A note of warning is sounded by Francis N. Howland, President of the Building Material Dealers' Association of New York, touching the depressing effect likely to be shown in the volume of spring building as a result of the advancing prices of materials.

Mr. Howland takes the ground that the trade will be wise to resist advances not absolutely warranted by the law of supply and demand for the reason that any other policy must in the end defeat its object by greatly curtailing the activities of the speculative element.

"The manufacturers of building materials ought not be deluded by appearances of present building prosperity," says Mr. Howland. "It is still in the middle of winter and while the inquiry is good the prospective builders for the most part are merely feeding the market. High prices of building materials will be sure to frighten off the speculative builder and the big operator who contemplates construction is going to be tied up by non-arrival of steel and other metals entering into big building construction. It is all right to excuse the present tendency to inflate market prices of building commodities on the plea that supplies are low, labor is costing more and fuel is costly and has to be laid in now to anticipate possible coal shortages in the spring, but unless the manufacturers heed the advice of wise heads among them they are going to stifle what building demand does exist and will end by having their stocks on their hands.

"We have an operation on Twenty-eighth street that was started last September, but we have not been able to get a pound of steel to the job since then. That is only one instance, but it shows just what is happening in all departments of construction. It is no time to check building. Quite on the other hand it would be most advantageous all around to meet the situation half way."

* * *

That no abatement in the tide of structural activity exists here in Philadelphia is shown by the report, from official figures, for the first month of 1916, just issued by the local Bureau of Building Inspection.

This report shows the total estimated cost of buildings for which permits were issued during the month to have been \$1,859,000, an increase of \$948,285 over the figures of the corresponding month of 1915. It is pointed out that inasmuch as these totals do not include the cost of many items omitted from general contracts, the actual value of the work for January of the present year may exceed \$2,000,000, a most auspicious beginning for mid-winter.

Then, again, the report points out, there were no permits issued for exceptionally large amounts. There were 513 permits for buildings of all types, and well distributed through-

out the city, a condition which is always beneficial to the trade in general.

The figures for last month not only compared very favorably with those for January, 1915, but ranked fourth in comparison with the corresponding months in previous years since 1906, and were only exceeded in 1907, 1910 and 1911.

* * *

Sustaining, you will observe, "The Guide's" oft-repeated assertion that this good old Quaker City is one of the greatest building centers in these United States, and is destined so to remain for many years to come.

* * *

Mr. Joseph Pennell has been discussing the architectural aspect of New York City with characteristic freedom and breeziness.

"Always I love to get the composition coming up the bay," says Mr. Pennell. "This year, however, there is no composition for me, for with the great new square boxes on either side the silhouette is hidden, though the canyon of the street grows finer and finer. The Singer Building has disappeared and the Woolworth Building has lost its towering majesty. In these subjects you must, or I must, see buildings as masses that lord it over the rest.

"But this is a time of levelling up or down; a time of the contractor, and a time for the town planner, the commonplace jerry builder, the vulgar machine made architect who would reduce everything to his own office space ideal, which is that of his patron. So this year from the bay New York is uninteresting; it is all big—all a level line—it does not climb and soar, as it did a couple of years ago. I have been drawing and etching these subjects coming back again and again with a fresh eye—and I know."

Apparently Mr. Pennell only goes away in order to come back with the fresh eye.

"But New York does strike the foreigner. Down Broadway there are endless new subjects. Stand, for instance, at the upper side of City Hall Square on Broadway and look south and you will see, or you can see, my design of the Woolworth Building. Now I know all of old Europe, the parts that are left and the parts that are gone, and there is nothing, there was nothing, to compare in grandeur and majesty with this vista down Broadway. Were it somewhere in Europe every one would be staring at it—ogling it—patronizing it—saying the correct things in the guide book about it—things that ought to be said. Here the guide book says nothing, and save for John Van Dyck and a few others who have imitated him no authors have dared to say anything. The cultured tell me I have made Broadway look very fine. Broadway to those who can see is the finest street in the world."

Pennell's reference to "the vulgar, machine-made architect who would reduce everything to his own office-space ideal, which is that of his patron," is all very well from the artist's point of view, but what, pray, is the architect to do? Assuming that he is not "vulgar" and not in the least "machine-made," can he be expected to induce the hard-headed investor in skyscraper construction that sky line and beauty and art and irregularity of outline are the main desiderata and that office space and the utilitarian sides of the project are of wholly subordinate importance? Would he get the commission if he did, There is a side other than the purely artistic to the work of the architect, be his ideals what they may. Buildings that "climb and soar" are beautiful in their way, but, unhappily, they cost millions to construct, and the men who disburse these millions do not, as a rule, share the Pennell enthusiasm for the etching possibilities of the finished effect.

* * *

Commenting on the Pennell observations, the New York "Sun" remarks:

"All this is very encouraging and reassures one after the rather depressing remarks

Mr. Pennell made in the beginning. We wish the sky line might have lingered a little while just in the way that Mr. Pennell liked it, but since the commonplace jerry builders and the vulgar machine-made architects had to go and spoil it, it is a consolation to know that at least we have one vista grander and more majestic than any that is or ever was in Europe. The New York guide books have, as Mr. Pennell says, been far too modest, but perhaps this reticence has been inspired by fear of the marauding jerry builders who destroy vistas often before they can be etched. What are jerry builders?"

* * *

Until February 7 there was on view in the studios of the National Society of Craftsmen a series of three panels—"Painting, Architecture and Sculpture"—by J. William Fossdick, to be placed in the grill room of the National Arts Club; also a group of three Flemish heads for an overmantel decoration. Mr. Fossdick's decorations are painted wood, the wood having been first slightly carved, tooled and in some cases raised with gesso. They are executed in the spirit of the early European panel painters.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

****THE NINTH CHICAGO CEMENT SHOW** will be held at the First Infantry Armory and the Coliseum, Chicago, from February 12 to 19, 1916. It was necessary to lease the Armory, as all space in the Coliseum had been assigned last February. The Second National Conference on Concrete Road Building will be held at the Auditorium Hotel from February 15 to 18, in connection with the Show. The Cement Products Exhibition Co., 208 South La Salle street, Chicago, has charge of the exhibition.

****BLAINE S. SMITH**, general sales manager of the Universal Portland Cement Co., was elected general secretary of the Chicago Association of Commerce at the annual meeting of that organization held December 8.

****A CONVENTION OF SPECIAL INTEREST** to brick manufacturers will be held at Reading, Pa., on March 9 and 10. It is the annual meeting of the Pennsylvania Housing and Town Planning Association at which Governor Martin G. Brumbaugh and Dr. Samuel G. Dixon, State Health Commissioner, will deliver addresses. Indications point to this convention as being one of the largest held in Reading for some years, as delegates from every section of the State will be present. The sessions will be devoted to the discussion of three topics—housing, health and city planning.

****THE NATIONAL FIREPROOFING CO.**, Pittsburgh, Pa., has decided to list its shares on the New York Stock Exchange, thereby securing a wider market for its securities. One of the requirements of this listing is that stock certificates shall be interchangeable between New York and Pittsburgh, and in order to have the shares listed, it was necessary to have new stock certificates engraved. The company has announced that, if stockholders desire to secure interchangeable certificates, they must present the ones now held to the transfer agents, the Commonwealth Trust Co. of Pittsburgh or the United States Mortgage and Trust Company of New York.

****ACCORDING TO STATISTICS** prepared by William Gamble, of the Bureau of Building Inspection, Philadelphia, the cost of building operations in that city during 1915 exceeded those of the previous year by \$2,500,000. The total estimated cost of all building work during November is \$2,408,665, showing a decrease of \$572,000 as compared with the figures for the previous month and an increase of \$1,168,135 over the corresponding month of 1914. The first eleven months of this year show expenditures for building operations of \$36,841,055, an increase of \$2,682,800 over the corresponding period of 1914. November of this year represented the third largest amount since 1905.

****THE EASTERN PENNSYLVANIA STATE BUILDERS' SUPPLY ASSOCIATION** will hold its annual convention in Philadelphia, Pa., during April, 1916.

****THE AMERICAN ENAMELED BRICK AND TILE CO.** announces the removal of its general offices to the Vanderbilt Concourse Building, 52 Vanderbilt avenue, New York City, where the Hay Walker Brick Co. will occupy adjoining offices. Andrew A. Ayers and William G. Black, formerly of Carter, Black and Ayers, will be associated with Robert L. Findlay in the last named concern.

****R. THOMAS SHORT**, for the last fifteen years associated with Herbert S. Harde, under the firm name of Harde & Short, with offices at 3 West Twenty-ninth street, has opened an office for the independent practice of his profession at 370 Macon street, Brooklyn. Herbert S. Harde is now located at 17 West Forty-fourth street, Manhattan. As a firm, Harde & Short planned a number of high class apartment houses in this city, among which the Turrets, Red House, Alwyn Court and the Parkview are notable examples. Mr. Short was the architect for model tenements erected by the City & Suburban Homes Co., the Tenderloin Police Station, the White Rats' club house and other well-known buildings. During the last few years Mr. Short has confined much of his activity to Brooklyn projects. His recent work includes the Shubert, DeKalb and Halsey Theatres, Kismet Temple, Bushwick Temple, Arcadia Dance Hall, Broadway Sporting Club, and a number of high class moving picture houses.

****AT A SPECIAL MEETING** of all Cleveland brick interests recently, Charles J. Deckman, of the Deckman-Duty Brick Co., was appointed chairman, and L. B. Koblitz, of the Americana Building Brick Co., secretary of a committee which will prepare an elaborate program for the entertainment of the delegates to the National Brick Manufacturers' Association convention, at Hotel Statler, February 20 to 26, 1916.

****ARCHIE REID**, OF NEWARK, N. J., newly elected president of the Face Brick Dealers' Association of America, has reorganized his Philadelphia business, making it a stock company. The concern will hereafter be known as A. S. Reid & Co., Inc., and offices will be maintained in the Morris Building, as heretofore. The officers of the new company are A. S. Reid, president; James T. Reid, vice-president; James Tongue, treasurer, and W. H. Gaul, secretary.

SOME MORE ADVERTISING "DON'T'S."

Don't try to do a million dollar business on a two thousand dollar basis.

Don't try to advertise a quarter page proposition in a three-inch space.

Don't belittle a big business reputation by running a piking little "ad" among piker competitors.

Don't overlook the fact that as a man is judged by his stationery, so a firm is judged by its advertising.

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

BUSINESS CONDITIONS AFTER THE WAR.

Judge Gary, of the United States Steel Corporation, Reviews Possibilities in the Wake of a Sudden Peace.

Judge Elbert H. Gary, president of the United States Steel Corporation, in a statement to the press issued recently, calls the attention of American business men to existing conditions and to what, in his opinion, may occur after the war ends. In brief, he advises the mercantile, commercial and industrial interests of the United States to be prepared for a sudden peace, pointing out that the belligerent nations abroad are rapidly reaching a condition of anaemia that sooner or later will sap their strength and will enforce a termination to the struggle, perhaps before diplomatic exigencies may warrant it. He says:

"What of the future? Who can say with any feeling of certainty? It may be very dark and desperate. It will be thus in Europe, and we in America will feel the effects to a greater or lesser extent. I am referring now only to economic features.

"The destruction of billions upon billions of property in any country must necessarily affect in some degree all other countries. The economic conditions in the United States may and should be good in a long future, with usual interruptions, if we are fully alive to our opportunities.

"I believe the wars of Europe will not be so long protracted as many, if not most, men predict. This opinion is based principally upon two grounds:

"In the first place, it seems apparent that little, if any, benefit to any belligerent country, or to the world at large, can result from the war except and unless it be the firm establishment of an international tribunal for the settlement of all international differences; one that is universal and practical and whose decrees are enforceable; one that will prevent the prolongation of wars in the future.

"The other ground for my belief is that each of the warring nations is starving for men and money both. They do not admit it, but the signs are plenty and convincing. Any nation that is prolonging the war beyond the time when it can be reasonably and honorably discontinued is slowly but surely committing suicide.

"But whenever the war shall close the business of this country will be confronted with new conditions. The purchasing power of the whole world will have been greatly reduced. Foreign countries who are now buying our products because compelled will withdraw their patronage in a large measure. Other non-producing countries will find their financial resources and credits lessened. More than this, foreign producers in great need, will strive more diligently than ever to supply the countries that are financially able to pay, and at prices based upon cheap labor

and low cost, as they have a perfect right to do. Our producers, including our wage earners, will find themselves in commercial antagonism with the most persistent and difficult competition ever experienced unless this shall be prevented by laws that are reasonable and sufficient.

"Another suggestion: We must be prepared for radical changes in volume, in prices and resources. There is danger of overproduction, overextension of credit and liabilities, overconfidence. Circumstances change like a kaleidoscope. We have observed this before and we shall see it again."

BUILDING OUTLOOK IN NEW YORK

Live Operation Contracts Worth \$20,000,000, or Twice as Much as a Year Ago.

Unless all signs fail, 1916 is to be a record-breaking year in the building trades in New York City, in the opinion of Franz Neilson, secretary Credit Association of the Building Trades of New York. The financial situation has righted itself, he says, and is growing better every day.

"Money is easy, and, fortunately, it is not seeking highly speculative outlets, in spite of the allurements offered by those who speak glibly of 'war brides' and 'war babies.' Investors are turning to real estate, which is one of the best indications that we have at least a decade of uninterrupted prosperity before us.

"The demand for new buildings continues to grow, the result being that contractors, sub-contractors and material men in this city are more busy than before in at least eight years.

"Figures are difficult to obtain, but I believe that at least \$20,000,000 in building operations in New York can be classed as alive at this time. This is almost, if not quite, 100 per cent. better than the record of a year ago."

"The members of the Credit Association of the Building Trades are all enthusiastic in their confidence. The only thing they demand to make themselves secure in the future is legislation to correct the evils of the present lien laws of New York, and to protect honest business men against the use of the second and third mortgage by speculative and dishonest builders. We are going to Albany with a demand for proper legislation, and we are going to have behind us a much stronger organization than ever before. About 150 sub-contractors and material men who were not members of the Credit Association have joined us during the last month for no other reason than their desire to make certain the protective laws for which we are working."

Don't expect outsiders to give you a big rating on a one-inch space.

WHAT CITY MANAGERS DO.

About forty-five American cities have so far adopted the commission-manager plan of government. The "American City" recently printed the portraits of twenty-nine city managers with brief biographical data, from which it appears that sixteen of the twenty-nine are engineers, one was a real estate agent, one was a fire insurance man, one a ranchman, another a school principal, one a court clerk, one was an auditor, one was connected with the Bureau of Municipal Research in New York City and several were managers of works.

The city manager is the administrative head of the municipal government under the direction and supervision of the commission. He may not hold any other office or employment, except that of notary public, nor be interested in the profits or emoluments of any contract, job, work, or service for the city.

He is vested with power to appoint and remove officers and members of all boards and commissions, heads of departments, and all subordinate officers and employees of the city, except as otherwise specified. All officers appointed by the city manager serve until removed by him or until their successors are appointed. It is his duty:

To prepare an annual budget and keep the commission advised of the financial condition and future needs of the city.

To install a complete and practical system of municipal accounting, with the proper system of checks between the various departments.

To take active control of the fire, police, sanitary, charitable and public works departments of the city, and to engage such assistants therein as are provided for in the charter or ordinance.

To supervise, under the direction of the commission, the administration of the affairs of the city.

To revoke licenses, pending the action of the commission.

To administer oaths and take affidavits.

To sign such contracts, deeds and other public documents on behalf of the city as the commission may authorize and require.

HOW A BOILER IS INSPECTED.

Few people have any conception of how thoroughly the process of examining steam boilers is carried on by the insurance company transacting boiler insurance. It would seem impossible that anything but an external examination, and a very superficial one at that, could be made of the average boiler.

The man who is intrusted with this important work, for upon the accuracy of the inspector's report hangs the whole fabric of boiler insurance, is usually a man of small stature. Having enveloped himself in complete overalls, with the exception of his face, hands and feet, he enters the boiler through the front manhole, sounds with hammer the shell and tubes and all braces which can be reached from that point, examines also the condition of the shell and tubes as to cleanli-

ness. He then emerges and enters the boiler again through the top manhole, sounding the shell, tubes and braces, which can be reached from that point.

Emerging from the manhole the inspector crawls beneath the boiler through the furnace doors, sounding the shell again as far as can be reached from the outside or on the side that is exposed to the flames and heated gases.

When finished at this point, he enters the back connection from the rear door, examining all points from there. The front and rear tubes as far as they are exposed and the blow-off pipes and all connections to the boilers are next examined, and when this has been completed the brickwork and setting are gone over carefully. The steam gauges are then tested and the general external conditions noted and carefully reported in detail.

When a boiler has come through such a crucial test as this successfully, it is safe evidence that its soundness is beyond cavil. It is only such a test as this that can stand, and it behooves all users of power to avail themselves of this safeguard. A boiler which is an unknown quantity is a terrible menace to life and property, and however capable the engineer, such supervision as is described would seem to be imperative, not only from a moral standpoint, but also from that of pecuniary interest.—"Commercial Bulletin," (Cleveland).

"COUNTRY PLANNING."

A new term has been written into the lexicon of architecture to signalize the birth of a new profession. Country planning, by which is meant the application of scientific principles to the conservation and betterment of public and private property in the country, has been taken up by a number of universities within a recent period and made the subject of lectures by professors from these seats of learning at teachers' and farmers' institutes in various States. It is the first intelligently directed movement for the physical improvement of rural townships as a whole.

Country planning is something more than the alter ego of city planning; it is something more than that composite of art, arboriculture and engineering which since Downing's time has been designated "landscape architecture." Country planning comprehends all these and has taken in also the essential principles of a number of amateur movements having for their general object the improvement of country life. It substitutes expert advice for merely food intentions. It develops and disseminates standards of design and construction for roads, playgrounds, schools, churches, town halls, cemeteries and home surroundings for the benefit of communities having the desire and the means to work them out. Prof. Waugh, of the Massachusetts Agricultural College, and Prof. Blair, of the University of Illinois, who described the movement before the City Club here on a recent evening, made it plain that the new science will have a broad application, one which will

not stop at city boundary lines.

A cardinal principle of country planning is that beauty is not measured by cost and should be obtained through simple means. This doctrine of simplicity and economy presumably accounts for a great deal of the popularity of the movement with country people. They are taught that good white lead is the best paint for the country home, for both appearance and wear; that if the blinds of a white house are painted green there will be sufficient relief and contrast; that the house should have broad, spreading lines; that it should be wider than it is high, because such proportion is in harmony with the amplitude of the country, and that every foot of height of ceiling calls for another ton or cord of winter fuel. If one can afford to ornament, he is advised that his means should go into broader eaves, ample fireplaces and good workmanship. Other keys to attractiveness for the farm home, as taught by the country planners, are: The place must be well clothed with trees and shrubbery; the house should be prominent and have a good setting; the trees grouped at the sides or rear and not scattered all over the place; no unnecessary fences, walks or drives; no rockeries, shells or statuary.

If the propaganda has its expected effect there will not merely be an improvement in the appearance of home farms, but also official action by town and village boards looking to the preparation of plans and specifications for such improvement of the public thoroughfares as a moderate tax roll will warrant for the present and future. We have seen in this State since the good roads were built a remarkable change for the better in the appearance of individual homes, but public improvements in the rural towns have been rare. This omission is mainly chargeable to the lack of good teaching in the past. Town boards have yet to learn how they can hedge their roadsides, emphasize the natural beauties of the landscape and indirectly add to the value and marketability of their real estate.—New York "Real Estate Record."

ADVANTAGES OF WINTER BUILDING.

In a circular published by the Detroit Steel Products Company, advocating a campaign for more building in the winter time, the writer says, among other things:

"The question of winter building is one that of necessity must be decided by the owner himself and he is generally not sufficiently informed to take the chance. All kinds of mason work are now carried on successfully at all times during the winter. Buildings of reinforced concrete, depending almost entirely upon concrete for support, are erected in the dead of winter. Mortar will not set as rapidly in winter as in summer, but mortar used in winter will become more durable than mortar used in summer. One reason for this may be that brickwork laid in summer absorbs the moisture from the mortar before it has had time to set.

"It is an accepted opinion of the public

that contracts for winter work can be let at a lower price than at any other time of the year; all things being normal. It is probable that about 10 per cent. of the cost of the building can be saved if contracts are let during the winter.

"The man who erects his building in the winter has the advantage of securing the higher class of workmanship represented by the more competent mechanics who are kept on the payroll during that period. Furthermore, as the contractor and architect are not rushed with the same amount of work as in the summer, each can devote more of his individual time to the construction of the building.

Better Woodwork is Possible.

"All woodwork which enters into construction of a building is far superior when installed during cold weather, the atmosphere being much dryer than in summer. Much of the moisture in the form of rain which is absorbed by the rough woodwork during warm weather, becomes snow in winter and is easily cleaned off before any material damage can be done. The moisture absorbed by the rough woodwork in summer will not dry out until some time after the building is completed and decorated. When this moisture dries out floors and partitions often settle, causing cracks and other defects.

"One of the greatest objections to summer building is the absorption of moisture from the air by the interior wood finish. This interior finish is one of the most important features of a building, and greater care and skill must be employed in its installation than with any other part of a building. It is always subject to more close inspection as long as a building stands, and it is important that every precaution should be employed to preserve the highest class of workmanship in the building as a whole. The moisture absorbed by the finish woodwork in summer will dry out later and cause joints to open, doors to shrink, panels to crack, and the work to assume the character of a building that literally has been thrown together. On the other hand, heat is maintained in the building erected in the winter, and, as a result, moisture is kept out and the finish remains in a first class condition."

TESTS OF HOLLOW BUILDING TILE.

Tests of hollow building tile have been made by the United States Bureau of Standards. A floor slab 6 feet wide and 30 feet long continued over three piers 15 feet apart was made of this class of material. This tile is of a special type for use in floor slabs and is made so that the bottom surface is about 2 inches wider than the top. In laying the tile in the form of a slab, the pieces touch on the bottom, but are about 2 inches apart at the top. This space continues throughout the length of the slab and is filled with a mortar of the composition of one part of cement and two of sand, in which are placed several reinforcing rods bent up at the ends of the slab

and continued through the concrete beam into the next adjacent slab.

In the present case the two slabs were allowed to age for one month. Tests were made of these, loaded uniformly with pig lead, numerous deflection readings being made as different loads were applied. One of the slabs failed at about 603 pounds per square foot. The other was able to withstand a slightly greater load, 690 pounds per square foot. Failure occurred in the mortar beams, due largely to the inferior grade of reinforcing used.

ELIMINATING THE DULL SEASON.

Many a man has made a success in business because he has gone ahead on the supposition that there is no such thing as an "off season."

Winter, since the year one, has been the "off season" in the building trades, but a few enterprising architects and contractors promise to put a few cracks in the precedent by showing that winter in some respects is a better time to build than the summer.

"Printers' Ink," the advertisers' journal, tells of a certain steel products company, making steel sash, which has secured opinions from 6,000 architects in the country on the question of winter building.

A New York architect stated: "We make it a habit to build in the winter time because the last building we erected then was built at approximately ten per cent. reduction in the cost of materials and labor."

Half the architects expressed themselves as favorable to the proposal and the company is now directing all its advertising toward persuading builders to release contracts at once instead of waiting for warm weather.—"Ohio Architect"

BUILDING INSPECTORS' CONFERENCE.

The Conference of Building Commissioners and Inspectors, whose first meeting in New York last May proved so successful, plans to meet this year in Chicago in connection with the meeting of the American Concrete Institute and the Cement Show, on February 14 and 15. The Building Inspectors' Conference proper will take place on Monday, February 14, including both morning and afternoon sessions. On Tuesday, February 15, is planned a joint meeting with the Concrete Institute, whose program will comprise subjects of particular interest to building officials, including building code requirements for flat slab and other reinforced concrete design.

The program on Monday, like that of last year, will be a series of informal "round table" discussions. Each subject after a short introductory talk, will be open for general discussion which will enable each official to present his own experiences and problems. Everyone who attended the meeting last year agreed that this interchange of information was most valuable. The building official is continually confronted with new questions

on which he can often obtain little help in his own community and it is of the greatest benefit to him to learn how the same questions have been handled in other cities.

Executive Committee: Rudolph P. Miller, New York, chairman; V. D. Allen, Cleveland; James G. Houghton, Minneapolis; S. A. Dies, Pittsburgh; N. A. McIver, Edmonton, Alberta; Sidney J. Williams, Madison, Wis., secretary.

BEAUTY IN COMMON PLACES.

At a luncheon of the School Art League in New York, Dr. Hamilton Wright Mabie said: "You will never have an art age in America until you have art in the kitchen. The Japanese have the sublime art inspiration because they pay attention to the beauty of every-day utensils. In Japan every little farm and village rivals in beauty the national palace and suggests in miniature that exquisite charm which gives us such pleasure. My plea is for more art in the common places."

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 27, 1916.—Sealed proposals will be opened in this office at 3 P. M. February 17, 1916, for the construction of an extension to the power house in connection with the Experiment Station, Bureau of Mines, at Pittsburgh, Pa. Drawings and specifications may be obtained from the superintendent of construction, 4902 Forbes street, Pittsburgh, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 25, 1916.—Sealed proposals will be opened in this office at 3 P. M., March 7, 1916, for the construction complete (including mechanical equipment and approaches) of the United States post office at South Bethlehem, Pa. Drawings and specifications may be obtained from the custodian of site at South Bethlehem, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., January 31, 1916.—Sealed proposals will be opened in this office at 3 P. M., February 29, 1916, for alterations to the United States post office and courthouse at Martinsburg, W. Va. Drawings and specifications may be obtained from the custodian at Martinsburg, W. Va., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Trade **KNO-FUR** Mark
Expanded metal plastering lath

This material is a special design of lath having ribs $\frac{1}{2}$ inch deep running diagonally across the sheets.

You save the time and labor required in placing furring strips if you use "Kno-Fur."

The ribs not only act as furring but they strengthen the lath very materially. "Kno-Fur" can be used on ceilings where the supports are spaced 24 inches apart without any difficulty from the lath sagging while the plaster is being applied.

This is only one of the types of expanded metal lath we sell. Let us tell you about them.

wood floors. Plans in progress. Architects
will take bids in about ten days.

If you can persuade people to buy your
goods you make money. "The Guide rounds
up in its clientele the people you want to
persuade. A certain amount of space and
the right kind of selling argument does the
rest.

Do you get "The Guide" regularly? You
should. Better subscribe now, while you
think of it, and keep in touch. The man who
fails to get and to read carefully the trade
paper of his chosen line, is missing a while
lot of valuable data that should be at his
command.

BUILDING LUMBER

3 YEARS Exposure to Steam and Acid Fumes

AGAIN PROVES THE VALUE OF

SAUMS PRESERVATIVE

PRINCETON WORSTED MILLS, INC., PRINCETON, N. J.

In 1912 the roof timbers in the dye house of the Princeton Worsted Mills were treated with **Saums Preservative**. These timbers are constantly subjected to steam and acid fumes. The dye vats were also treated. After 3½ years there is no sign of rot or checking in either the roof timbers or dye vats.

Another proof of the lasting qualities of **Saums Preservative**.

SPECIALIZED MEDIA FOR SPECIALIZED THINGS.

It must be evident to any thinking man that the place to advertise commodities or appliances special to any given industry is in the publications that reach that industry and that such advertising, if well written, well displayed and persistently kept up, will not only effect the desired sales, but will build up a permanent good-will asset of inestimable value. . . .—R. R. Shuman, in "Standard Advertising."

—MILLS—

"Satisfaction"

When a type of boiler is made for 40 years, and each year's sales increase over previous ones there is but one conclusion—
They must give satisfaction.

The H. B. SMITH CO.

1225 Arch Street

PHILADELPHIA - PA.

Few persons appreciate the enormous cost of advertising a popular product before it obtains popularity. One of the most successful advertisers in the country, whose income reaches hundreds of thousands of dollars annually, told *Leslie's Weekly* that he wasted at least a quarter of a million dollars "before he learned the advertising game." He estimates that he spent this amount on circulars, gaudy lithographs, sign boards, and street car advertising, out of which he received so little benefit, as far as he could trace it, that he regarded the expenditure as money pretty nearly wasted.

The darkest hour in any man's life is when he sits down to plan how to get money without earning it.—Horace Greely.

One way to escape the income tax is to quit advertising and do less business.

Editorial Comment

At the 20th annual convention of the New York State Association of Builders, held recently in New York City, there was an address, made by Ernest F. Eidlitz, counsel of the association, that should have the attention of builders not only in New York State, but in every State in the Union. Mr. Eidlitz's subject was the legal aspect of the legislative work done on behalf of the association and the necessity for active participation by builders in the framing of legislation affecting the building industry. Mr. Eidlitz said in part:

"Statutes are made by the Legislature and are quite different from that slow normal growth of consistent and related principles of the common law. In many instances they have no intimate relation to the general body of the law, but express radical reforms not even desired by the great body of the people.

"Under our system of government, laws passed by the Legislature must be applied by the courts, irrespective of the consequences. The courts cannot disregard statutes because they do not approve of them. Courts cannot legislate; that is the province of the Legislature.

"It is important for the building industry that an association of this character shall make every effort to influence the Legislature to enact laws which adequately protect you in the conduct of your business and which do not inequitably interfere with your interests.

"The following I should give as some of the principal reasons for improper legislation, having legislation affecting the building industry in mind.

"First. Bills do not happen. They are initiated and drafted by some interest for a selfish purpose and frequently in disregard of the rights of others accepted thereby.

"Again, the interests behind the bill make every effort to procure its passage, whereas sometimes there is no opposition, due to lack of knowledge or interest on the part of those adversely affected, and many times the opposition is badly organized and ineffective.

"Another reason is the lack of requisite expert knowledge on the part of the legislators. They also are in ignorance of the conditions affected by the bill and do not appreciate the results which will ensue. The legislators have not sufficient time to devote to the study of the bills, so as to inform themselves of the merits or demerits of the same. There are from two to three thousand bills introduced each session.

* * *

"The system of log rolling also plays an important part. This is voting or pushing a bill, in which a legislator is not interested and not in accordance with the exercise of his own judgment, but at the request of another legislator, who in turn uses his influence in

behalf of some measure in which the former is interested. These reasons suggest the remedy for obviating detrimental legislation.

"The machinery must be provided to examine every bill introduced in the Legislature and to select those affecting your industry. Those selected must be carefully studied and analyzed to determine their real intent and application. There must be then somebody to consider the bill from its legal and practical aspect and to decide whether and in what respect it affects the industry favorably or unfavorably, and if the latter whether and how it should be amended.

"The views and arguments must then be presented to the legislators and must be backed by the weight of a thorough organization to properly impress them with the extent of the opposition or approval and the importance and number affected. Opportunity is given by the Legislature and the Governor to all interested to present their views, and it is in the formation of the statute that an organization like this may influence legislation. While it is possible to repeal a statute at some succeeding session, such a task is much more difficult."

* * *

In Mr. Eidlitz's official report a resume of bills introduced in the State Legislature during the last year was given.

Robert L. Christie, chairman of the Legislative Committee, gave statistics of the work of the committee in the last five years and showed what benefit had been derived from its labors, and how the building trade as a whole has been protected from vicious legislation.

The idea of a Legislative Committee, co-operating with a competent attorney, to keep careful tab on new legislation hurtful or mischievous in its effect on the building industry, is one that should be adopted by associations of builders everywhere. When it is considered that probably seventy percent. of all the vexatious statutes introduced are the work of men who are either without practical knowledge of the conditions sought to be corrected, or, as is only too often the case, frankly "playing at politics," the importance of a Legislative Committee will not be overestimated. The trouble with most committees of the kind is that they cease to remain active. To be effective a legislative committee must be "on the job." It should have an arrangement with somebody at the State capital as well as with local legislative centers, to forward promptly every piece of new legislation with bearing on the building trades. If a bill is decided to be hurtful to the best interests of the trade, this committee must be in a position to rally to the movement for its defeat every influence at the command of the building industry.

If there were more such committees, active

and vigilant in behalf of the trades, there would be, we may be sure, less cause for complaint regarding the disposition of the law-making powers to hamper and restrict various lines of business.

It is because the business man is careless, or unobservant, or too deeply engrossed in the details of his own affairs to watch the trend of State acts and local ordinances, that he is so frequently made the victim of meddling and annoying legislation.

The Legislative Committee supplies the logical remedy.

* * *

By the way, while we are on the subject of builders' associations we should like to remind our many readers that the 4th annual convention of the National Association of Builders' Exchanges is to take place at Baltimore on February 22. Questions of more than passing importance to the trade are to be given consideration at this meeting, which should be liberally attended. "The Guide" is advised that the Philadelphia Master Builders' Exchange, which is now one of the largest bodies of its kind, as to membership, in the United States, will be represented at the Baltimore convention by a big delegation, made up of the "live wores" and "hustlers" that have been making history in the recent activities of this fine old organization. The convention is expected to be one of the largest gatherings of builders and representatives of builders' exchanges ever held in this country. Mr. J. M. Vollmer, secretary of the Builders' Exchange of Louisville, Ky., is secretary of the National Association, and will be pleased to look after the comforts of those who anticipate being present. The convention will be in session three days—February 22, 23 and 24.

* * *

Another gathering of scarcely inferior interest in some respects, will be the Conference of the National Building Inspectors now in session in Chicago. The program includes the following topics of discussion:

- (1) A review of the past year, including progress in code writing and revision, notably in New York City, including also an account of important fires.
- (2) Discretionary power of building officials; its proper limits and use.
- (3) Building code requirements for special building materials, such as gypsum blocks, hollow tile, terra cotta, metal lumber and metal lath.
- (4) The shingle roof.
- (5) Classification of and requirements for lodge halls, also rooming houses.
- (6) Other suggested topics will be added if time permits, such as limits of height and area; distinction between building and fixtures, including wooden dwarf partitions in fireproof buildings; licensing and bonding contractors; organization of a building department.

* * *

New York City is still busy with the question of how best to deal with the annoying and expensive duplication of inspections inci-

dental to its building laws. Chairman Kirkus, of the Conference Committee of Realty Owners, which is agitating the amalgamation of all the various activities concerned with building inspection, in one department, is reported as saying, in a recent interview:

"The worst disasters in the city in recent years can be traced to multiplicity of inspections, and he believes recurrence of them can be stopped forever if one department is made responsible for the rigid enforcement of the law.

"The Fire Prevention Bureau of the Fire Department," continued Mr. Kirkus, "had the enforcement of the law regarding fire drills and the installation of fire alarms in the Diamond factory in Brooklyn. The inquest following the fire brought out the fact that there were neither drills nor alarms. The State Labor Department is authorized by law to enforce the provisions regarding the building of fireproof or fire resisting exits; to enforce the law regarding unlocked exits and exits opening outward. None of these provisions for the safety of tenants were enforced. The State Labor Department requires counterbalanced stairways, but in the Diamond factory the stairway, when an attempt was made to lower it, I am told, fell on to the top of an exit door at the ground level, making both exit and stairway useless."

The impossibility of complying with all orders of the various departments is pointed out by Mr. Kirkus, who says that the Tenement House Department calls for ladders at the bottom of fire escapes, while the State Labor Department demands counterbalanced stairways. The last section of the new Building Code dealing with exits from buildings has been completed after the views of experts from all over the country had been consulted. In spite of this the Fire Prevention Bureau of the Fire Department is issuing orders regarding exits, having made rulings which are entirely its own, and in no way related to the provisions of the Building Code.

"How can anyone know what the law is?" Mr. Kirkus continued. "No matter how much one would like to obey it, it is impossible. We certainly do not intend to remove safeguards. Far from it. By the removal of divided responsibility we expect to erect a real safeguard. It has been proven that divided responsibility makes possible the locked door and prevents proper fire escapes or means of exit, as well as fire drills and alarms.

"We want consolidation of all inspections of buildings to be erected in New York City. Then it will be necessary for builders to file plans with one department which same department will give a certificate that the building is properly constructed or altered. Such building can then be sold or leased and the buyer or lessee can feel assured that he is not the owner or tenant of a structure that any hour may take a terrible toll of life."

* * *

The idea of the Realty Men is that the enforcement of every law and regulation relating to a building, new or old, shall be invested in one bureau so that the owner may know

without indirection, delay or unnecessary annoyance just what requirements are to be met and under what head such requirements are to be exacted.

A reasonable demand, we should say, if legally practicable.

QUALITY OF CYLINDER GLASS.

The merits of 32 ounce glass are frequently misrepresented or exaggerated by interested parties, and the actual quality of this kind of glass is not understood by the ordinary buyer.

From a recent letter from the American Window Glass Company, who are recognized authorities on this subject, addressed to one of their customers, we quote as follows:

"We exceedingly regret that the architect saw fit to reject this glass. We do not claim our 32 ounce glass to be as good as plate.

"As you are well aware, it is a blown article and it would be a physical impossibility to make it without waves. We can positively state that there is no 32 ounce glass made in this country or abroad that is superior to our glass, and the only glass you could get that would be superior in quality would be polished plate glass, as the grinding of the glass makes it smooth and free from waves.

"As I understand, these lights are of average large size for building purposes, and it is natural that the larger the light is the more the waves will show. If this glass were in 6, 8 or 10-inch widths you could hardly tell it from plate glass."

In this connection, the so-called Crystal Sheet Glass is also a blown article, and is nothing more or less than a good quality of heavy blown window glass.

READY TO TAKE ORDERS.

The foreman swore at Cassidy for not fully loading up his hod. The hod, he said, would hold so many bricks and Cassidy must take a full load up the ladder every trip.

One morning the supply of bricks ran out, and Cassidy, after gathering every brick in sight, found he was still short of the proper number. He yelled up to a workman on the fifty story.

"What do you want?" asked the workman.

"Throw me down wan brick," shouted Cassidy, "to make good me load."

SOME MORE ADVERTISING "DONT'S."

Don't try to do a million dollar business on a two thousand dollar basis.

Don't try to advertise a quarter page proposition in a three-inch space.

Don't belittle a big business reputation by running a piking little "ad" among piker competitors.

Don't overlook the fact that as a man is judged by his stationery, so a firm is judged by its advertising.

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

Miscellaneous Construction News

Residence, near Wilmington, Del., \$250,000. Architects, McClure & Harper, Church Building, Wilmington. Owner, John J. Raskob, Dupont Building, Wilmington, Del. Stone, fireproof, 2½ stories, steam heating, electric lighting, tile and marble work, concrete fireproofing, dampproofing, parquet floors, cabinet work. Plans completed. Owner will soon award contract on a percentage basis.

Bank Building, Laurel, Del. Architect, Edward C. May, Dupont Building, Wilmington, Del. Owners, People's National Bank, E. E. Wooten, cashier, Laurel, Del. Brick, granite, terra cotta and steel, 2 stories, tin and copper roof, steam heating, electric lighting, marble work, composition flooring, metal lath, waterproofing, banking fixtures. Owners have purchased a new site. New plans will be drawn for a larger building.

Residence (alt. and add.), Philadelphia Pike, Wilmington, Del. Architect, Edward Canby May, Dupont Building, Wilmington, Del. Owner, Frank D. Lackey, Ninth and Market sts., Wilmington. Stone, 3 stories; new wing, 65x40 feet, slate roof, steam heating, electric lighting, tile work, hardwood floors, metal lath, dampproofing. Plans in progress.

Apartment House, Wilmington, Del. Architects, E. L. Rice, Jr., & Co., 815 Market street, Wilmington. Owner's name withheld. Philadelphia Steel and Forge Co. (O), Tacony, Philadelphia. J. A. Hand (C), 8029 Frankford avenue. Cost, \$300. Engine room and workshop, Milnor and Bleigh streets.

Frank & Seder (O), Eleventh and Market streets. Standard Const. Co. (C), 820 Drexel Building. Cost, \$1,400. Store, Eleventh and Market streets.

S. Sadiecki (O), 4551 Milnor street. Christian Dear Sons (C), Third and Northeast Boulevard. Cost, \$400. Dwelling, 4553 Milnor street.

J. Reed (O), 1609 West York street. F. A. Isphording (C), 1527 West Dauphin street. Cost, \$315. Dwelling, 1609 West York street.

Somerton M. E. Church (O), Somerton, Philadelphia. William D. Bubeck (C), Somerton, Philadelphia. Cost, \$570. Church, Cemetery Road and Poquessing avenue.

H. L. Weiner, Jr. (O), Stephen Girard Building. E. Tourison (C), 1001 Chestnut street. Cost, \$9,900. Dwelling, Cheltenham avenue and Morris street.

Al. Riegel (O), 3604 North Seventh street. David Shull (C), 3602 North Seventh street.

A STRONG ELEMENT IN VALUES.

The Minnesota State Art Commission contends that there is a "dollar and cents value" to "Art," and cites consular reports in proof of the statement. Every builder consciously or unconsciously proves the same thing. One house is a success. Why? The people like it; it is convenient; it is well arranged; it is good to look at and to live in. In other words, it is well designed. It is a good piece of work, well conceived and well executed.

People have set up a shrouded form which they have called "art" and which they have sought to worship in art museums and picture galleries, neglecting the humble applications of this great power and thereby losing its dynamic force. Art is from the same Latin root as artisan. It means work that is well done; work so well done that like a perfectly cut jewel, you may look at it from any point of view and still find no flaw in it. It must be carefully thought out, logical and consistent; it must be so well done that it is always good to look at; it must fully and completely fit the need for which it is intended. The essential parts must be co-ordinated each to the other. It is not necessary to strive after certain effects. The "perfect piece of work" becomes a "work of art."

This "perfect piece of work," when he approximates it, is the chief asset of the builder and makes great architecture. It is the object toward which the home builder is working. Beauty has undoubtedly an economic value.

"Do what you are paid to do—and then some—it's the then-some that gets your salary raised."—James B. Miller.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

****TO MAKE EVEN MORE ATTRACTIVE** the night school classes for workingmen, the Trenton (N. J.) Board of Education has decided to establish an evening class in the manufacture of pottery. A room in the plant of the Thomas Maddock's Sons Pottery Co. has been provided free of charge, the city paying for the services of the teacher. This innovation will be made to let the men living in the neighborhood of the pottery feel that they are at liberty to attend the class under less formal circumstances than some think they can do at present. These men, the majority of who work in the pottery by day, will be welcomed in the clothes they wear in the shop. Archibald M. Maddock, president of the pottery, has taken a deep interest in the advancement of his men and for some time has had a private class in the trade in the afternoon. A local high school teacher has been employed by the firm to give the course of study in the afternoon, but the evening class, it is believed, will furnish more men with an opportunity to improve their skill.

****F. A. HOILES, OF ALLIANCE,** was elected president of the Ohio Face Brick Manufacturers' Association at the annual meeting held in Columbus, December 15. George J. Markley was elected vice-president; L. G. Kilbourne, treasurer, and Carl C. Walters, secretary.

****NATIONAL ASSOCIATION OF BUILDERS' EXCHANGES** will hold its annual convention at the Hotel Emerson, Baltimore, Md., February 22-24, 1916. Secretary J. M. Vollmer, Louisville, Ky.

****THE SECOND ANNUAL MEETING** of the New Jersey Clay Workers' Association drew together an enthusiastic representation of Jersey's manifold clay activities. It was held at Rutgers College, New Brunswick, N. J. The newly elected officers were: Charles Weelans, Monument Pottery, Trenton, N. J., president; Howard Valentine, of R. N. & H. Valentine, Woodbridge, N. J., vice-president, and Cullen W. Parmelee, Rutgers College, New Brunswick, N. J., secretary-treasurer. Members of the Executive Committee: H. C. Mehrhoff, Little Ferry, N. J.; D. H. Applegate, Red Bank, N. J.; William Bedson, Trenton, N. J.; Douglas Fisher, Sayreville, N. J.; John H. Leisen, Woodbridge, N. J.; August Staudt, Perth Amboy. C. A. Bloomfield, retiring president, was unanimously elected an honorary member of the Executive Committee.

****A. W. SCHERER,** architect, 136 South Main street, Dayton, Ohio, desires samples and catalogues from manufacturers and jobbers interested in the building trades.

****LUX MANUFACTURING CO.,** Hoboken,

N. J., recently appointed R. A. Berrenberg general salesmanager of the company.

****L. W. SCHAEFER,** architect, has opened an office for the practice of his profession in the Terrace Building, St. Cloud, Minn., and desires catalogues and samples from manufacturers interested in the building trades.

****J. A. LOHMAN,** architect, Donora, Pa., has taken his son, F. A. Lohman, into partnership with him in the practice of his profession. The business will in future be conducted under the firm name of J. A. Lohman & Son.

****JAMES E. TAYLOR,** formerly Street Commissioner of Paterson, N. J., has organized the James E. Taylor Contracting Co., which will make a specialty of rigging, heavy trucking, structural steel construction and the erection of boilers and stacks.

****NATIONAL BUILDERS' SUPPLY ASSOCIATION** will hold its annual convention at Cleveland, O., February 17-19, 1916. Headquarters at the Hotel Statler.

****CECIL MOOKE,** formerly connected with the Nazareth Cement Company, 1270 Broadway, has recently joined the selling force of the P. F. Kenny Co., 33 Old Broadway, New York.

****AMERICAN ENAMELED BRICK AND TILE CO.** has moved its general offices to the third floor of the Vanderbilt Concourse Building, 52 Vanderbilt avenue. Announcement is made that the newly formed Hay, Walker Brick Company, of New York, with adjoining offices, will be the selling agents of this company in the metropolitan district and with whom Messrs. Andrew A. Ayres and William G. Black, formerly of Carter, Black & Ayres, will be associated. J. Francis Booream is secretary and treasurer and C. A. Gardner general sales manager of the American Enameled Brick and Tile Co.

****NATIONAL ASSOCIATION OF BUILDERS' EXCHANGES** will hold its annual convention at the Hotel Emerson, Baltimore, Md., February 22-24, 1916. Secretary, J. M. Vollmer, Louisville, Ky.

****ONE OF THE MOST INTERESTING REPORTS** presented at the recent convention of the American Institute of Architects was that of the Committee on Contracts and Specifications, which recorded the completion of the new Standard Documents of the Institute and which represent the results of the joint committee of the American Institute of Architects and of the National Association of Builders' Exchanges. In connection with this matter great credit is due to the tact and perseverance of Frank Miles Day, a former president of the institute, and to the committee of which he was the head.

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 8, 1916.—Sealed proposals will be received at this office until 3 P. M., March 21, 1916, and then opened, for the interior finish (except mechanical equipment and elevator) and completion of the approaches of the United States post office, at New Haven, Conn., in accordance with drawings and specifications, copies of which may be had at this office or at the office of the architect, James Gamble Rogers, 470 Fourth avenue, New York City, in the discretion of the Acting Supervising Architect. The building is of approximately 28,000 square feet ground area; three stories and basement; fireproof construction. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 8, 1916.—Sealed proposals will be opened in this office at 3 P. M., March 21, 1916, for the installation complete of the mechanical equipment (except elevators, lifts, and lighting fixtures) of the United States post office at New Haven, Conn., in accordance with drawings and specifications, copies of which may be obtained from this office, or at the office of the architect, Jas. Gamble Rogers, 470 Fourth avenue, New York City, in the discretion of the Acting Supervising Architect. James A. Wetmore, Acting Supervising Architect.

HAD TO HAVE AN OFFICE.

An inherited fortune and the disposal of an organized business enabled a well-known Chicagoan to retire. He had the inclination for leisure, but could not surrender the idea of having a definite business abiding spot.

He rented an office in a loft building and went to Europe. After a six months' absence he returned, looked the building over and went to South America. Then, after again verifying the report that the building was not crumbling, he took a jaunt to Japan.

Not long ago one of his old cronies said:

"Frank, why don't you give up your office—you don't need it?"

"That's true," said Frank. "I would give it up, but I don't know what to do with the rug."

There never was, never will be, a better medium for the man who has something to sell to a given class of buyers than the trade paper whose circulation is limited to that class. Newspapers with their swollen circulations strike at best but a chance target here and there. The trade paper carries your rifle fire to targets exclusively. You can't miss,—if your ammunition's right.

UNION METAL COLUMNS

"The Ones That Last a Lifetime"

These columns are made with shafts of open hearth steel formed in correct architectural proportions by means of special dies and machinery.

For Porches, Pergolas, Interiors

They will not split, check, rot or open at the joints as wood columns are certain to do sooner or later.

Protect the appearance of your work by using and specifying Union Metal Columns.

The Union Metal Mfg. Co.

CANTON, OHIO.

PEARCE FIREPROOF CO., PHILA.

Trade *Kno-Burn* Mark

EXPANDED METAL PLASTERING LATH

Actual Size of "Kno-Burn" Mesh

This is the original small diamond-shaped mesh expanded metal lath.

The small mesh requires less plaster to form a perfect "key" than a lath having a larger mesh.

The shape of the mesh is such that the plaster flows around the strands completely imbedding them.

"Kno-Burn" can be quickly and easily shaped to fit any curve or angle without special tools.

We carry complete line of all gauges.

RAILINGS AND GATES OF CHARACTER AND BEAUTY

Iron Railings and Entrance Gates of appropriate design and perfect proportion would add much to the dignity and attractiveness of many country places. In other locations, for the protection of lawns and gardens, an

ANCHOR POST FENCE

with galvanized steel posts and woven wire panels, makes an admirable and long lasting enclosure.

We have catalogues illustrating Entrance Gates and Iron Railings, Lawn Fences, Tennis Courts, Poultry and Kennel Yard Enclosures, Aviaries, Arbors, Trellises, etc., and will gladly mail you the one you need.

If you've got a specialty that will commend itself to builders, make a contract for space and start right in and talk about that specialty. Dwell on its good points, point out its advantages over similar devices, set forth its dominant qualities. And keep right on, week after week talking about it. If you don't book orders we'll bet you a big red pippin that there is either something better on the market or your specialty isn't worth a kopeck noway.

Editorial Comment

For years the cry has been heard that architectural exhibitions fail to draw the public largely because their appeal is to a limited class. It has been urged that if a way could be found to combine with the purely architectural side of exhibitions of the sort something in the line of extra features with popular appeal, the great public might be induced to come and the success of exhibitions of the kind be thus assured. Yielding to this cry, the Architectural League of New York has attempted this year the experiment of an exhibition to which has been added these "popular" features.

An article from the pen of the Art Editor of the New York "Sun" affords some idea of the light in which the innovation is regarded.

"The Architectural League exhibition is generally considered to be the most popular one of the year," says the "Sun." "The current show will not be an exception. There is the usual diversity of decorative wall paintings, great and small (referring of course to size, not to qualities, the great mural painters having turned out little this year), the usual sculptures, textiles, tiles, ironwork and the usual modicum of architecture.

"The crumbs of architecture flung to us this year seem less than usual, but on the other hand we are recompensed with an elaborate Italian garden, with terraces, real pools of water and real hedges, the whole Vanderbilt Gallery being given over to this spectacular effect, which will strike the thoughtless dumb with admiration. It is not a real garden. It is not copied from a real garden and it is not a model that any sensible person would incorporate into a landscape. It turns the gallery into a stage setting, provides an agreeable background for one or two unimportant pieces of sculpture and makes it well nigh impossible to give any serious attention to the architectural plans in the corners of the room.

* * *

"The design to make the Architectural League more popular than ever will doubtless succeed, for the baits flung out are precisely the kind that our good natured public loves to nibble at, but that any serious gain to the cause of architecture is achieved is less than doubtful. The embellishment of the exhibition has gone so far that the exhibition itself is lost sight of.

"However, since the committees have erred, it is well they have erred so magnificently, since extravagance of this sort is almost self-correction, and the outcries of the suffocating and swamped architects will compel a return to less fussy methods next year. The danger will be that the revolt will swing too far into puritanism and that next year we shall be crying out that the Vanderbilt Gallery has

become a barn. But at all costs we must give architecture a fair chance in the Architectural League exhibitions.

* * *

"Architecture more than most arts needs to be talked about, and the methods imposed upon architects by what is called 'modern civilization' are so arbitrary and difficult that it is no longer possible for an architect to work out a problem from an individual experience, but he must rely more and more (under the present system) upon organized effort. To me it seems that the New York architects are for the most part up against impossible conditions. The efforts being made by them are as valiant as any that past artists have made, and the intelligence might be said to be equal to that of the architects of the past, were it not essentially unintelligent to attack unsolvable problems.

"The two great handicaps that modern American architects labor under when they strive to compete with ancient masters are known by all of us and have been mentioned in these columns to the point of boredom. No real effort to break the shackles and free architects is being made, however. The prospects of such a campaign are so far reaching, and there is so much complexity in the way of politics and finance that the leadership of a Napoleon is necessary, a Napoleon who shall be backed by a Ford or Carnegie endowment fund."

* * *

"Merely to be clear, the two restrictions hinted at are these: Lack of municipal control over city architecture and the mechanical methods of constructing modern buildings. A building that looks as well on paper as an ancient master's work is rendered stupid by the mechanical fashion in which it is erected. If by a miracle it looks well, even then the day after something erected next to it utterly ruins its effect.

"New York at present is probably the richest city in the world, certainly it is the place where the world's money is being handled, yet in all of its miles of streets it has no 'places,' it has no picturesque street crossings, no backgrounds for monuments and no framework for parks, in short it lacks all the architectural attributes of a beautiful city. Until there is control and restriction New York never will be anything but a puzzle to lovers of the beautiful.

"To brag about the height of the Woolworth Tower is beside the point. A short time ago we bragged about the Singer Building just as lustily. To build such expensive structures for a reclame that lasts but two or three years (until the still higher tower comes along) is like a child's game. Joe Pennell is already shouting that the Woolworth Tower has been spoiled for him by the towers of the

new Equitable Building, but we needn't bother about Joe here. The fact is it is time for the architects to look our much vaunted 'liberty' in the face and determine how much as artists we want of it. At present our idea seems to be that it gives each of us a chance to shout aloud. We do so, there is a great uproar and all ideas are engulfed—only the uproar is heard.

* * *

"The idle public will flock to the galleries to see the Italian Garden and the gimerack decorations (at least I hope they will, for there is no reason why they should not abstract such entertainment as they may from these features), but the attention of architects will doubtless focus upon Mr. Goodhue's model for the proposed new church for St. Bartholomew's. They should also take an earnest look at the interesting exhibition of the American Academy in Rome and sigh for the days when they too were students abroad and planning idealistic monuments.

"A criticism of the proposed new church is not possible without the plans. In fact, criticism of architecture is never called for by the Architectural League, for the simple reason that the works of art themselves are not on view. Talk is possible, and the more talk before the building goes up the better.

* * *

"Whether architecture has advanced or not the fact is undeniable that the art of presenting architectural ideas to clients has progressed immeasurably. Every year, it seems to me, the architectural models and the sketches of facades and interiors get more and more alluring and less and less criticizable. The model for St. Bartholomew's is so impressive that any mere committee must be bowled over by it instantly. The feeling of any vestryman must be 'Yes, yes, put it up to-morrow.' And at the rate our mechanics are perfecting themselves the time is not far distant when such buildings really will be built in a day. But the hopes and fears that I have for the new St. Bartholomew's are all connected with the manner in which it will be built, its site and the possibilities of what is to be built next door.

"Without having seen the site, it is evident that the last contingency is one that is to be reckoned with, as it was in the building of St. Thomas'. Certain places appear in the model to have been sliced off with a great knife. These are the places where the building connect no doubt with something already standing. The masses of the new building culminating in a tower are carefully filed one upon the other in the effort of self-protection against the unknown structure that may be erected near by. To make a design that shall compose with something as yet undecided upon has been the unfortunate architect's terrible task.

* * *

"My own experiences with St. Thomas' Church, I know, are not isolated. Others have gone through the same set of feelings. It is not that I share the invincible prejudice some people have against placing such ambitious

churches upon corner lots. If the rest of the block were in settled architecture and all the surroundings were fixed in a composing scheme I could conceive of a chapel hitching on with grace to the other buildings. There are innumerable examples in existence in the old world, as every one knows.

"My difficulty is that after having been intensely concerned in the spectacle of the construction of the building, often going considerably out of my way on my daily walks merely to catch a glimpse of the agreeable masses of stone as they emerged from the debris that surrounded the workmen, I have now lost interest utterly in the finished building. I get almost as faint an artistic sensation from it as from St. Patrick's. Like the Cathedral, it is cold and mechanical and seems to have been turned out by a machine in one day.

* * *

"The modern method of following implacably the architect's plan, the impossibility of ever once changing a door or a window once the contractors have started to work, is death to the design. It happens that one of the few of our pew structures whose detail I can inspect twice with pleasure is the interior of George Gray Barnard's 'Cloisters,' and Mr. Barnard always laughingly says it has no architecture. However, the arches in it were torn down and rebuilt when they didn't happen to suit the first time. Miss Gertrude Stein's new studio of Paris, Mr. Barnard's workmen worked until they satisfied the eye.

"Miss Stein often laughs over the summer she spent in remodeling her studio. Although the alterations in it were slight, it seemed to require a great many French workmen, and there was an incessant accompaniment of argument and criticism as the work proceeded. The wives and mothers of the workmen used to come and join in the contentions aroused by the work and the air of detachment from modern life displayed by all concerned was so great that Miss Stein ended by calling the company 'her club.' She herself, being a thoroughly modern spirit, occasionally tried to hasten the proceedings, but was always met with a rebuff from the old chief workman, who said, 'Il faut contenter l'oiel,' and to an artist that argument is insurmountable.

"However remote the dream of mediaeval workmanship may be from the scheme of the present, all must admit that could Mr. Goodhue's design have been carried out by mediaeval workmen, its chances for remaining interesting even when completely finished, would have been greatly enhanced."

* * *

There is healthy criticism here that we feel sure will be largely approved by architects who have not yet become completely commercialized. The best results are attainable under conditions not always possible to our modern modes of working. Many things enter into the ensemble of good architecture that are beside the design in itself. The "Sun" man states these so clearly and with

facilities involved that we feel sure his comment such a sympathetic understanding of the dif- ment will be read with interest by architects.

It is apparent that the plan to popularize the architectural exhibition has not been the success anticipated. The defect has been the defect common to attempts of the kind—viz., an unconscious dwarfing of the real purpose of the function achieved in the effort to give it popular appeal.

* * *

As we go to press for this issue of "The Guide," the fifth annual convention of the National Association of Builders' Exchanges is under way at Baltimore. The program arranged follows:

Monday, February 21, 8.30 P. M.—Reception tendered to visiting delegates and ladies by the Builders' Exchange of Baltimore and the Ladies' Auxiliary Committee, roof garden, Emerson Hotel.

Tuesday, February 22.—First session at 11 A. M.; address by the president, H. L. Lewman; Emerson C. Harrington, Governor of Maryland; James H. Preston, Mayor of Baltimore, and others; appointment of committees, etc. 2.30 P. M., automobile trip around city. 7 P. M., oyster roast at Recreation Pier.

Wednesday, February 23, 10 A. M.—Business meeting; 11.30 A. M., a reception by his Eminence James Cardinal Gibbons, at the Cardinal's residence, to the delegates and ladies of the convention; 2 P. M., reports of committees, etc.; 8 P. M., theatre party at Albaugh's Theatre.

February 24—Business meeting, 10 A. M., and another at 2 P. M.; 8.30 P. M., grand ball, Emerson Roof Garden.

Friday, February 25—The delegates will visit Washington and will be the guests of the Builders and Manufacturers' Exchange of that city. Visits will be made to Annapolis and other places of interest, including a special reception at the White House by the President.

* * *

About five years ago the National Builders' Exchange held its first meeting in Philadelphia. The attendance at this convention was about a baker's dozen.

Not in the least dismayed by this showing, the members decided to hold their second meeting in Washington, D. C. There were about 40 persons present. Louisville was selected as the meeting place for next year and about 350 persons attended the meeting.

Last year the convention was held at Columbus, Ohio, and was a rousing success. It was attended by representatives from more than fifty exchanges, who with their friends totaled about 700 persons.

The rapid growth of the National Association of Builders is due to the fact that it has laid a broad and solid foundation for future generations of builders. Its work for mutual helpfulness and increased efficiency has faithfully continued, irrespective of all impediments, as any natural force does, and is now, save for one or two, the largest commercial organization in the United States.

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

"City Planning for Philadelphia" was the topic of discussion at the session of the Monday conference in the Curtis Building. Andrew Wright Crawford spoke on "Metropolitan Planning as Related to Philadelphia," taking up the need for constructive work in developing the city.

Albert Kelsey, fellow of the American Institute of Architecture, discussed the Parkway, its history and its future. George S. Webster, Director of Wharves, Docks and Ferries, addressed those present on the comprehensive planning for Philadelphia as endorsed by the present administration.

We know lots of men who have made money without the aid of advertising, but—they haven't made it since 1876.

PLACE AND VALUE OF THE TRADE PAPER.

"Eloquent speakers who have preceded me have told of the greatness of our American industries, and have rightly given to advertising a large measure of credit for our industrial and commercial supremacy.

They have spoken of the daily and weekly newspapers, the agricultural press, the magazines, the billboards, the street cars, and even the advertising novelties, as the forces that have played an important part in this wonderful upbuilding, but they have wholly missed the greatest force of them all—the trade and technical press of the country."—R. R. Shuman before the annual convention of the Associated Advertising Clubs at Omaha.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

**ROGER H. BULLARD, architect, formerly connected with Grosvenor Atterbury, has opened offices for the independent practice of his profession at 331 Madison avenue, New York City.

**EMPIRE SIDEWALK BRIDGE CO., INC., has opened an office at 30 East Forty-second street, New York City.

**ROBERT C. WHEELER has been appointed city engineer of Summit, N. J., to succeed Alexander Blair.

**BAY STATE PINK GRANITE CO. has moved its offices to larger quarters at 105 West Fortieth street, New York. This firm has recently received the contracts to supply the granite for the new building for the Rochester, N. Y., Chamber of Commerce, the Schenectady Trust Company Building, the Vincentian Institute at Watervleit, N. Y., and the South Broad Street Plaza at Philadelphia. Hugh Kafka, formerly well known as an architect, is in charge of the New York office of this concern.

**HENRY W. ISENBERG has recently joined forces with his father, Henry R. Isenberg, 337 Plane street, Newark, N. J., who has been in the tiling and interior marble business since 1897. Mr. Isenberg has lately returned from the Exposition, his father deciding to complete his education by sending him on a trip through the country. Mr. Isenberg is one of the well known young men of Newark and was a very popular high school student. He is a graduate of Southside High School, was captain of the football team for two years and the basketball team last season. In his studies, as in his athletics, he was always well up in his class, and we prophesy that his addition to the force at 337 Plane street will mean the introduction of a real live wire into the business.

**NEW YORK BUILDING MANAGERS' ASSOCIATION, at its recent annual meeting, elected the following officers for the ensuing year: B. E. Martin, president, re-elected; F. S. Bancroft, vice-president; C. B. Best, treasurer; Raymond P. Roberts, secretary. Members of the Executive Committee to serve three years include C. T. Cooley, J. C. Renard, M. D., Littlefield, Henry Voorhis and W. H. Class; member to serve two years, in place of Mr. Roberts, who was elected secretary, H. L. Eckerson.

**BUILDERS' AND TRADERS' EXCHANGE, of Newark, N. J., at its annual meeting held in the exchange rooms, elected the following officers for 1916: Walter A. Lawson, president; Hugh Kinnard, vice-president; Lewis C. Rusling, treasurer, and Charles

M. Grover, secretary. The following directors were elected: For three years, John W. Shaw, A. H. Vreeland, Thomas Boyle, Fred. Clark; for one year, John F. Day. Mr. Day retires after serving the exchange for the last two years as its president. Mr. Lawson, the president-elect, has been identified with the heating and ventilating business for the last 25 years and has been a member of the exchange for 20 years. For the past six years he has served on the Board of Directors.

**MANHATTAN ASSOCIATION OF MASTER PLUMBERS at its recent annual meeting elected the following officers to serve during the ensuing year: Isaac J. Brown, president; Thomas P. McLoughlin, vice-president; J. L. Murphy, treasurer; Charles Ericson, recording secretary; John D. Cooley, financial secretary; Philip Fich, sergeant-at-arms; Andrew J. Davis, marshal. The new Board of Trustees is composed of Frank J. Fee, Harry Hemlin, David Delgan, Joseph H. Booth and J. H. Jasper. The following were elected as representatives to the Greater New York Association: James P. Knight, James Smith, Thomas J. Cummins, B. F. Donohue, F. B. Lasette, George H. Creasy, Frank J. Fee, John Renahan, Philip Eich, Andrew J. Davis, Thos. P. McLoughlin, Arthur S. Gaynor, Jerry L. Murphy, Harry Hemlin, Charles Ericson and Joseph H. Booth.

**THE LEHIGH PORTLAND CEMENT CO. announces the naming of Harold M. Scott as assistant secretary and the appointment of B. H. Rader as Western sales manager, effective at once.

**BUFFALO FOUNDRY AND MACHINE CO., Buffalo, N. Y., recently opened a New York office at 17 Battery Place.

**OTTO E. GOLDSCHMIDT, consulting engineer, has moved his offices from 9 East Fortieth street, New York City, to the Tilden Building, 105 West Fortieth street.

**JOHN A. BRASHEAR, past president of the American Society of Mechanical Engineers, has been elected an honorary member of the Engineers' Club.

**EXHIBITS FOR THE ARCHITECTURAL LEAGUE.—The jury appointed by the Architectural League of New York to select drawings and plans for the thirty-first annual exhibition has completed its work. Exhibits chosen are: Drawings of proposed restorations in the City Hall, by Grosvenor Atterbury; Alfred W. Brunner's plans of the stadium built for the College of the City of New York; plans of the Ryan Art Gallery, by Thomas Hastings; designs for the new Colony Club, by Delano & Aldrich; Cass Gilbert's un-

published designs of the Woolworth Building, and Alfred Hopkins' drawings of the facade front of the new court house in Second avenue.

**NATIONAL RADIATOR CO., Johnstown, Pa., has recently moved its New York office from 30 East Forty-second street to the Sheridan Building, Sixth avenue and Thirtieth street. C. N. Tull, formerly connected with the Philadelphia office of the company, is now in charge of the local office.

**FRANK A. BUCKHAM, for many years treasurer and general manager for the Nason Manufacturing Co., has severed his connection with that concern and has become associated with the Walworth Manufacturing Co., Boston, Mass., as manager of its New York branch, with offices at 19 Cliff street.

**C. V. R. BOGERT, a prominent architect of Hackensack, N. J., has become associated with Clarence W. Brazer, with offices at 1133 Broadway, Manhattan.

**MOUNT VERNON CITY PLANNING COMMISSION—Mayor Fiske, of Mount Vernon, has announced the members of the new City Planning Commission, in accord with resolution of the Council and the State law of 1913, giving such power. Members and terms of office are as follows: John R. Rockart and Rabbi Joseph I. Gorfinkle, for three-year terms; John G. Wintjen and Joseph S. Wood, for two-year terms, and Thomas F. Gerity and Arthur F. Brinckerhoff, for one-year terms. A. F. Brinckerhoff, the landscape architect, will bring to the Commission the results of his experiences and professional study of landscaping and parking. Mr. Gerity is associated with Knoedler & Co., art dealers, in New York, and Rabbi Gorfinkle and Mr. Wintjen are widely known public-

spirited citizens of that city. Mr. Rockart is a member of the firm of Cass Gilbert, who designed the Woolworth and many other famous buildings.

**A. G. SCHUMANN, vice-president of the Moeller & Schumann Co., varnishes and enamels, Brooklyn, was recently elected president of the Travelers' Association of the paint and allied trades of New York City.

**JOHN J. BRACKEN, civil engineer of Newark, N. J., has been appointed town engineer of Harrison, N. J. Mr. Bracken has been engaged in private practice, mainly on municipal work, at Newark since 1902.

**JAMES C. KELLY, for many years connected with Berry Brothers, has become a member of the sales force of the Moller & Schumann Co., Marcy avenue, Brooklyn, manufacturers of varnishes and enamels.

**YALE & TOWNE MANUFACTURING CO., 9 East Fortieth street, New York City, makes announcement of the appointment as general manager of E. C. Waldvogel, who has been connected with the company for the past eleven years and has successively filled the positions of traveling salesman, sales manager and assistant general manager. In addition to the duties belonging to his new office, Mr. Waldvogel will have general supervision of all sales, domestic, Canadian and export.

**NO AWARD MADE THIS YEAR for the Henry O. Avery prize by the Architectural League. The medal for architecture was awarded to Cass Gilbert for the Woolworth Building. Herbert Adams received the medal for sculpture for the Spencer Trask Memorial, and the medal for painting was awarded to Violet Oakley, of Philadelphia. This award was based on the design for the Dante window and her murals for the decoration of the Pennsylvania State Capitol at Harrisburg.

the power plant and content themselves with the rentals from the first and second floors and the basement. There is, however, a better and less drastic remedy than this, and I hope the owners will find it.

Cost of Foundations and Roofs.

A common error regarding this matter is that the foundations and roof cost the same in a very high building as in one of moderate size. This is not altogether true even of the roof, but as regards the foundations such a claim is utterly untrue. The foundations of the Woolworth Building aggregated in cost, I believe much over a million dollars—more than the total cost of any skyscraper in Toledo. Another thing is perhaps still more important. If one has planned a twenty-story building and is considering making twenty-two stories, he ought to reflect that his expense will not only be increased by the two additional stories in themselves, but that they will compel a strengthening of the balance of the building all the way down to and including the foundation—they will compel an additional expense upon twenty floors in order to furnish an approximate support for the additional two stories to be erected upon them. Again, two floors so high up require far more elevator service than do the fourth and fifth floors; for example, each of the additional elevators required, uses greater proportionate power and repairs than other elevators and occupies a valuable space (worth something like \$4,000 a year in the aggregate), on each of the twenty floors below the twenty-first.

Forty years ago it was the fashion to erect buildings with a height of twelve or fourteen feet for each story. Consequently what was once the leading office building in this city has five stories, while in the same height the modern building adjoining it has six; and again the modern building's rooms are considerably smaller than those of the old building and consequently easier to heat, light and furnish. Taking all these things into consideration, the modern building is probably twice as efficient as its neighbor; for in obedience to the idea of magnificence prevailing at that time, the old building had many long, high, narrow rooms, whose space is comparatively valueless.

Often, as in the case last mentioned, such indulgence in fancy is totally without any excuse in reason or common sense. It illustrates to what extent we are swayed by fashion and vanity even though the cost be ruinous to us. A melancholy feature of this matter is that anyone who makes an honest and manly resistance to a prevailing craze may do so at his own loss. An able architect of my acquaintance lost the commission for a great building mainly because he persistently argued to the owner the impolicy of excessive height in proportion to the breadth of the building. Many architects, I fear, smother their more accurate knowledge on this subject and console themselves with the thought of the large commission they will draw, without extra labor, on the dozen addi-

COMMON ERRORS IN BUILDING

Magnificence or Shabbiness are the Usual Extremes to be Found in Modern Structures

Errors in building are mainly of two kinds: first, errors of magnificence, and second, errors of shabbiness. Of the two the former is clearly the most dangerous and destructive, for a shabby building can easily be taken down with little loss and replaced with one more suitable to the location; whereas, in many cases, an error of magnificence means not only a loss of the world's capital, but in many cases also a continuous loss in the operation of the building—a loss, that is, in comparison with the result which should have been attained.

Two Examples.

I have in mind two buildings, each entitled to be called magnificent. One is twenty-one stories high and the other twelve. The former is a narrow structure and the latter broad. The building contains only half of the offices that the twelve-story building possesses. Yet

it has the same number of elevators and I believe the general upkeep expense to be about as large as in the lower building. Accordingly each office in the high building has to stand an overhead expense twice as large as that in the lower building. The latter, therefore, can be earning a handsome profit while the former is losing money.

The offices in the tall, thin building cost \$4,000 apiece to build; those in its competitor, though built equally well, cost but \$2,000 apiece. In the tall, thin building the power plant costs about \$25,000 a year to operate, making a charge against each rented office of \$100 per annum for this expense alone. Only income from the ground floor and other sources make it practicable to operate such a building at all; and it is a serious question whether the owners would not do well to close up the upper floors, cease the operation of

tional floors which their employer desires to put up for the purpose of making a display.

An Expensive Error.

Errors of this kind are often committed by men otherwise very able. One instance within my knowledge was particularly disastrous. An investor intending to erect a new skyscraper disregarded the fact that his proposed building would dwarf another building in which he was interested. If, on the contrary, he had limited the new building to ten stories, a fine even effect of height would prevail along the street in question. In spite of this he put up six additional floors, and his example being followed by another property owner, a jagged and irregular effect was produced along the street and both interests were obliged to engage in a starvation fight for tenants. This caused not only a depression in the finances of the owners themselves, but was also a factor in a general depression in real estate on account of the numebr of vacant windows shown in these two buildings and in those with which they competed.

Make a City Beautiful.

Those who are interested in the general prosperity of the real estate business should struggle against errors of this character which gives real estate a bad reputation and their city an irregular and crude appearance.

I question very much if in any city of the size of Toledo there is any true economy in erecting a building higher than eight stories. It would, in my opinion, be cheaper to buy the adjoining land and spread the building over a wider area if great floor space is required. The steel structure has been a new toy in the building world. It is about time that the toy ceased to amuse and more common sense be used in planning buildings.

Errors of shabbiness are so obvious as not to require discussion. If a man has a lot worth \$100,000 and puts a building on it which costs only \$2,000 and brings in very little rent, he is clearly losing money every day that this condition exists. Yet some wealthy men seem to take a gloomy satisfaction in handling their property in this way.

The increasing esprit de corps of the real estate fraternity and the greater diffusion of information on this subject will no doubt do much to eliminate these errors and to add to the efficiency of future improvements and to the beauty of our cities. An American city which can combine the modern scientific building, efficient, light, convenient and finely finished, with something of the even, harmonious development of Paris will reach a height not yet attained by any city in the world.—C. S. Ashley in "Record and Guide."

ARCHITECTS AND THE PRESS.

Fifty dollars reward is offered by the "Architectural Review," 144 Congress street, Boston, for information that will lead to the belief and conviction of any live chapter of the American Institute of Architects, or any local Architectural Club, which has held a special or monthly meeting prior to January 1, 1916, at which local newspaper men were

present as honored equals and invited guests, and which was designed to acquaint them with what the architect stands for in his community, and help the architect to realize what the representatives of the press consider to be "news" in architecture.

Much of the misunderstanding as to the proper appreciation on the part of the public of the profession of architecture, and the responsibilities and duties of an architect, to them as individuals and to their community, lies in the absolute divorce at present existing between the dignified isolation of the profession and all ordinary and customary channels of human communication. If the press could be brought to rightly understand the professional attitude of the architect, they would gladly co-operate with him in placing his important work intelligently before their readers, and giving those responsible for it all due and proper credit. Would it not better pay you, personally, and in the long run redound to the better credit of your profession, to go to the necessary bother of meeting this other "servant of the public" at least half-way in coming to a common understanding?—"Architectural Review."

TEACHING THAT SHOULD BE "SCRAPPED."

Present interest in the development of efficiency in technical schools, with a view to making the courses thoroughly modern, practical and immediately serviceable, recalls conditions not so admirable, which prevail in many manual training departments of the ordinary high school. General criticism cannot be applied, as the methods in vogue differ from city to city. There is, however, ground for the belief that a training which is designed to make the student more valuable as a handicraftsman succeeds only in giving him a vague and unreliable smattering of information on half a dozen topics. For instance, a boy is given a few score hours of desultory training in carpentry and woodturning. He constructs a grandfather clock, a tabouret, and a napkin ring. A little later, he is permitted to make "patterns" and to cast them—with plaster of Paris, ramming the molds by hand. Forging is taught by the aid of small hand forges and blacksmiths' anvils. The whole course is buttered with a little mechanical drawing. In the light of modern manufacturing methods, such as confront a young man when he takes up an industrial career, the whole affair seems a waste of time. It might be a help to a future "desk man," who will some day make a wife's heart glad by nailing up a shelf without accident; but a hindrance to him who seeks knowledge of manufacturing processes as they exist to-day, not as they were yesterday. Such "manual training" is obsolete.—"Iron Trade Review," Cleveland.

The finest automobile will not run when the tank is empty, and the finest space can not pull unless it is filled with copy that grips interest.—"Printer's Ink."

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 8, 1916.—Sealed proposals will be received at this office until 3 P. M., March 21, 1916, and then opened, for the interior finish (except mechanical equipment and elevator) and completion of the approaches of the United States post office, at New Haven, Conn., in accordance with drawings and specifications, copies of which may be had at this office or at the office of the architect, James Gamble Rogers, 470 Fourth avenue, New York City, in the discretion of the Acting Supervising Architect. The building is of approximately 28,000 square feet ground area; three stories and basement; fireproof construction. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 8, 1916.—Sealed proposals will be opened in this office at 3 P. M., March 21, 1916, for the installation complete of the mechanical equipment (except elevators, lifts, and lighting fixtures) of the United States post office at New Haven, Conn., in accordance with drawings and specifications, copies of which may be obtained from this office, or at the office of the architect, Jas. Gamble Rogers, 470 Fourth avenue, New York City, in the discretion of the Acting Supervising Architect. James A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 17, 1916.—Sealed proposals will be opened in this office at 3 P. M., March 30, 1916, for the construction complete of the United States post office at Huntingdon, Ind. Drawings and specifications may be obtained from the custodian at Huntington, Ind., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Don't try to see out of some other man's eyes when you've got a pair of your own,—use them and go over every job carefully before you consider that you are through with it, and don't forget that one "good job" is a better advertisement than many poor ones.—Exchange.

ABSOLUTELY NECESSARY.

We may live without poetry, music and art;
We may live without conscience and live without heart;
We may live without friends, we may live without fads;
But business to-day cannot live without ads.

Once-in-a-while advertising is like once-in-a-while eating. Good in its way, but decidedly not nourishing.

Chanelath RIBBED EXPANDED METAL

"Chanelath" is a new expanded metal product consisting of T-shaped ribs $\frac{7}{8}$ inches high, spaced 4 inches apart and joined together by an expanded metal fabric of small meshes as shown in the illustration.

"Chanelath" is specially suitable for all kinds of plastering work where auxiliary studding or furring is required for the T-rib acts as a studding or furring.

"Chanelath" is also designed for use as a combined form and reinforcing in the construction of concrete roofs and floors. In this work the fabric acts as a form and also as a reinforcing, but the greatest reinforcing value is in the T-rib.

Prices and complete data furnished by us.

UNION METAL COLUMNS

"The Ones That Last a Lifetime"

These columns are made with shafts of open hearth steel formed in correct architectural proportions by means of special dies and machinery.

For Porches, Pergolas, Interiors

They will not split, check, rot or open at the joints as wood columns are certain to do sooner or later.

Protect the appearance of your work by using and specifying Union Metal Columns.

Branches: St. Louis, Mo., Baltimore, Md.

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation. Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases. Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

Write for Booklet.

Manufactured only by

PHILADELPHIA

BUILDING LUMBER

Barrett Specification Roofs

Cost nothing to maintain—

If you incorporate The Barrett Specification verbatim in your building plans, you then will get—

1. —a roof that has a lower cost per year of service than any other roof covering known.
2. —a roof that costs nothing to maintain.
3. —that is endorsed by the Underwriters' Laboratories and takes the base rate of insurance.

4. —a roof that will give twenty years or more of service.

5. —that is recognized as standard everywhere and that to-day covers most of the first class buildings in the country.

We should like to send every architect, engineer and owner of buildings a copy of the Underwriters' Laboratories Report on Barrett Specification Roofs and also a copy of The Barrett Specification.

Address nearest office.

Special Note

We advise incorporating in plans the full wording of The Barrett Specification, in order to avoid any misunderstanding. If any abbreviated form is desired, however, the following is suggested.

ROOFING—Shall be a Barrett Specification Roof laid as directed in printed specification, revised August 15, 1911, using the materials specified and subject to the inspection requirement.

THE MONTANA APARTMENTS
375 Park Avenue, New York City

Architects :
Rouse & Goldstone, N. Y.

Roofers :
Tuttle Roofing Co., N. Y.

Tar-Rok (Tar Concrete) Sub-Floors

These have been used for upwards of thirty years in mill construction to provide a permanent, inexpensive wood floor laid directly on the soil.

The Barrett Specification for Tar-Rok Sub-Floors provides for a form of tar concrete that is easily and cheaply laid and which is of the right character to exclude all dampness of the soil and protect the planks from decay. This form of construction is cheaper than any air space or cellar construction and furnishes an ideal base for machinery as well as a warm, dry floor for workmen. Booklet on request.

Velvex Creosote Shingle Stains

Being made with creosote as a base, they preserve the wood against decay. Made in many soft velvety colors. Permanent and cheap. Booklet on request.

Editorial Comment

At the recent convention of the National Association of Builders' Exchanges, at Baltimore, the retiring president, H. L. Lewman, of Louisville, Ky., created some stir by an address touching upon the necessity for classifying architects.

In part he said:

"I desire to call your attention particularly to one matter, as I think this largely influences your future success. I refer to the classification of architects. Though the people understand there are doctors and quacks, lawyers and shysters, and so on through all the trades and professions, yet we generally let the people believe there is no distinction between architects.

"This situation is unique and is no doubt brought about by our past subserviency and our present enforced silence and submission in localities where the new contract documents are not in use.

"It appears to me that it is our duty to the public and ourselves to use sterner methods than those of the past year, and turn the full light of publicity on those architects who refuse to use the new documents and who are still clinging to the 'comfortable blanket clauses' under which the ignorant and incompetent architect seeks to protect himself."

He also said that "building ethics are appalling," that bids on contracts are frequently secured by methods of unfairness and misrepresentation, that the competitive methods foolishly admit all sorts of "treachery and auction-room bargaining." He said he was not speaking against fair and honorable competition, but that he wanted some improvements on "the methods of 100 years ago."

His report was adopted by the convention and copies of it will be sent to all the individual exchanges for consideration.

* * *

The New York "Sun," with a view to stimulating popular interest in country house design, announces its second country house competition. The competition is for floor plans and perspective for a country house which can be built at a cost of not more than \$4,500. No designs are to be accepted from practicing architects, the contest being limited to draughtsmen in architects' offices. It is further limited to employees of firms whose offices are within the boundaries of Greater New York, Long Island, Westchester County, N. Y.; Hudson, Bergen, Morris, Essex, Passaic, Union, Middlesex and Monmouth Counties, N. J., and Fairfield County, Conn., and the students of all architectural schools within these boundaries; students of the Society of Beaux Arts, New York City, and of the architectural schools of Columbia College, University of Pennsylvania, Harvard and Cornell Universities and the Massachusetts Institute of Technology. All designs submitted are to be judged by a jury of profes-

sional men consisting of John Russell Pope, Burt L. Fenner and Samuel P. Trowbridge, and for the four best designs selected by them as having the best qualities, judged from the terms of the competition, the "Sun" will award prizes as follows: First prize, \$250; second prize, \$150; third prize, \$50; fourth prize, \$50. The terms of the competition are:

First—The design must be for a two-story and cellar all the year house. An attic may be included if desired. The building must be one that can be erected, exclusive of cost of land, in the suburban district of New York, for a cost not to exceed \$4,500. It is assumed to have not more than 28,000 cubic feet of contents from the cellar floor. Included in the cost must be all charges for a complete building except for lighting fixtures and decorations. Plumbing fixtures, heating plant and wiring for lighting must be included.

Second—For the purposes of this competition the plot on which this house is to be erected is assumed to be level and of an area 100x100 feet. It is assumed that the ground is free of rock and can be excavated at the usual cost for such work.

Third—No limit is placed on the area of the structure and the materials to be used in construction except those of cost and size of plot.

Fourth—It is assumed that the house designed will be for the use of three adults, two children and one servant.

Fifth—All drawings shall be rendered in pen and ink and shall consist of a plot plan drawn to a scale 1-16 of an inch to a foot; a perspective of the front of the house drawn to a scale 1/4 of an inch to a foot on the nearest corner and plans of both floors drawn to a scale 1/8 of an inch to a foot. All drawings must be mounted on cardboard.

Sixth—The plot plan must indicate the position of the house on the plot. For this purpose it is assumed that there are three adjoining plots each 100x100 in size, any two of which are assumed to be built on already. The competitive plan must show the proposed improvement of the third plot and its relation to the other two. This block plan must show approaches, paths, garage and garden details of one of them. Floor plans and perspective are to be of sufficient detail that finished plans can be made from them.

Seventh—All plans are to remain the property of the various contestants, but the "Sun" reserves the right to publish any or all of them without further compensation than has been stated above. Plans are to be returned to competitors as soon after the close of the competition as practicable. The "Sun" will take reasonable care of all drawings, but will not be responsible for any drawings lost or damaged.

Eighth—This competition is to be closed

at midnight, March 26. All competitive drawings must by that time be received at the office of the "Sun," 150 Nassau street, New York City.

Ninth—All designs are to be signed by a character selected by each competitor. Accompanying all drawings must be sealed envelopes containing full name and character mark of each competitor; name and address of office in which he or she is employed or the school at which the competitor is studying, and the following form signed by the full name of the competitor:

I (we) affirm that the design and plan submitted by me (us) in this, the "Sun's" Country Home Competition, are of my (our) own original conception, and have not been adapted or copied from any other design or plan.

Signature.....

Tenth—Each competitor must submit with his drawings a description of his building, materials, etc., the description to be limited to not more than 500 words.

Judges of this competition will be asked to base their awards on the fitness of the design to the material employed, the adaptability of the design, the excellence of the plan and the possibility of production within the allowed amount.

This competition is intended to provide a means for young draughtsmen to express their ideas regarding modern country home planning. It is the hope of the "Sun" that through the expression of such ideas, gained from a study of present day requirements, a type of modern country home may be evolved which will answer the demand for a combination of attractiveness, comfort, stability and efficiency, all at reasonable cost.

The "Sun" has attempted to make the terms of the competition as clear as possible in the program. Experience indicates that many competitors will want to know a good many details more than are published. The "Guide" is advised that all inquiries addressed to the "Sun" will be answered fully and promptly.

* * *

At a masque given in the studios of Louis C. Tiffany recently in honor of Mr. Tiffany's birthday, that distinguished designer made a brief address on modern art and critics that has since given rise to considerable discussion. The more notable—and quotable—paragraphs are here reprinted for the benefit of those who, having heard informally of Mr. Tiffany's address, are besieged by a natural curiosity to learn just what views it may have embodied. The part in reference to modern art and critics is as follows:

"What is the quest of beauty? What else is the goal that an artist sets before him but that same spirit of beauty? Who can give the formula for it? Are there not as many different paths to it as there are workmen, and are there not as many different definitions of beauty as there are artists, and yet I wish to express what I have found in art. How can I say in a few words what I have been striving to express in art during my life?

"Art starts from an instinct in all—stronger in one than another; and that instinct leads to the fixing of beauty in one of a hundred ways. But, if we look closer, we find some artists are drawn aside from the pursuit of beauty to worship the idol of technique, though only a small part of the effectiveness of a work in art can be credited to technique. The thirteenth century stained glass makers were great because they saw and reproduced beauty from the skies and stars—the gems and rugs; they translated the beauty into the speech of stained glass. In later days, ignoring the beauty of the glass by using paint, destroyed, by this technique, the beauty for which they were striving.

"If I may be forgiven a word about my own work, I would merely say that I have always striven to fix beauty in wood or stone or glass or pottery, in oil or watercolor, by using whatever seemed fittest for the expression of beauty; that has been my creed, and I see no reason to change it. It seems as if the artists who place all their energies on technique have nothing left over for the more important matter—the pursuit of beauty. The 'Modernists'—as they are called for want of a better term—wander after curiosities of technique, vaguely hoping they may light on some invention which will make them famous. They do not belong to art; they are not artists; they are untrained inventors of processes of the arts.

"One thing more—it seems to me that the majority of critics miss the chance of doing good by failing to understand the situation; too many of them waste their time in disapproval of what they dislike, instead of looking for what they can honestly admire. The public thinks that a critic is a person who attacks and condemns; a critic should be one who discriminates. The critic who can do good is one who does not neglect the high lights for the shadows, but strives to find the best points in each work of art, and to show his discrimination by setting them clearly before the public.

"I wish to end by two quotations from Philip James Bailey:

"'Art is man's nature; nature is God's art.'

"'The worst way to improve the world is to condemn it.'

"Forgive me for this delay. I wanted to protest that beauty can be found in any material, through the proper channel."

ITEMS TO BE CHARGED TO OVERHEAD.

Rules for Finding Cost of Doing Business and Net Profit or Loss.

The items which should be charged up to the cost of doing business, or overhead expense as it is called, are set forth in a set of rules compiled by the National Association of Credit Men. These rules also explain how any man can find out what percentage his

cost of business is of his sales and his net profit or loss on the business he is doing, as follows:

1. Charge interest on the net amount of your total investment at the beginning of your business year, exclusive of real estate.

2. Charge rental on real estate or buildings owned by you and used in your business at a rate equal to that which you would receive if renting or leasing it to others.

3. Charge in addition to what you pay for hired help an amount equal to what your services would be worth to others; also treat in like manner the services of any member of your family employed in the business not on the regular payroll.

4. Charge depreciation on all goods carried over on which you may have to make a less price because of change of style, damage, or any other cause.

5. Charge depreciation on buildings, tools, fixtures, or anything else suffering from age or wear and tear.

6. Charge amounts donated or subscriptions paid.

7. Charge all fixed expenses, such as taxes, insurance, water, light, fuel, etc.

8. Charge all incidental expenses, such as drayage, postage, office supplies, livery or expenses of horses and wagons, telegrams and telephones, advertising, canvassing, etc.

9. Charge losses of every character, including goods stolen or sent out and not charged, allowance made customers, bad debts, etc.

10. Charge collection expenses.

11. Charge any other expense not enumerated above.

12. When you have ascertained what the sum of all the foregoing items amounts to, prove it by your books, and you will have your total expense for the year; divide this figure by the total of your sales, and it will show you the percentage which it has cost you to do business.

13. Take this percentage and deduct it from the price of any article you have sold, then subtract from the remainder what it cost you (invoice price and freight), and the result will show your net profit or loss on the article.

14. Go over the selling prices of the various articles you handle and see where you stand as to profits, then get busy in putting your selling figures on a profitable basis and talk it over with your competitor as well.

ABSOLUTELY NECESSARY.

We may live without poetry, music and art;
We may live without conscience and live without heart;
We may live without friends, we may live without fads;
But business to-day cannot live without ads.

Once-in-a-while advertising is like once-in-a-while eating. Good in its way, but decidedly not nourishing.

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

MODERN PLANING MILL.

The Penn Planing Mill Company was incorporated in Pennsylvania on April 2, 1902, having purchased the business of the F. Shunk Planing Mill Company, which company had been operating for more than fifty years.

The company's plant was destroyed by fire in 1911.

In 1912 a new mill, 90x200 feet, was erected at Second and Grape streets, Reading, Pa. This mill was equipped with the most modern wood working machinery obtainable.

The situation of the plant is an ideal one. It is operated entirely by electricity, and employs at the present time sixty hands. The plant is so arranged, however, that the number of operators can be doubled at any time.

The experience of the company's officers, combined with their modern plant, assures to any one placing contracts for wood work the best possible results, both as to superiority of products and the prompt delivery of same.

The officers of the Penn Planing Mill Company are: Harry Shunk, president; K. M. High, vice-president; C. B. High, secretary and treasurer.

In addition to their main office at Reading, the company has a Philadelphia office, in charge of Mr. Edward Scully, which has recently been opened at 3307 Powelton avenue.

BE PROGRESSIVE.

The best is the cheapest on both ends and in the center. Improvement does not impose a tax, as efficiency pays for itself. The penny scripper cannot possibly hold out against as much as the gloomy, ugly, and unobliging progress. The best equipped shop never asks establishment. Be progressive.

George W. Blabon Co. (O), Twenty-first and Hunting Park avenue. William Steele & Sons Co., 1600 Arch street. Cost, \$3,000. Machine shop, Blabon street and P. and R. R. R.

J. Gibson McIlvain (O), 1420 Chestnut street. William A. Patterson (C), 5333 Vine street. Cost, \$1,500. Two dwellings, 5717-19 Ashland street.

Max Aaron (O), 217 Apslay street. M. L. Bean (C), 4411 Germantown avenue. Cost, \$700. Storage, 1917 North Broad street.

Frank G. Richards (O), 118 West Phil Ellena street. Samuel Harding (C), 20 East Johnson street. Cost, \$600. Dwelling, 118 West Phil Ellena street.

John M. Neilloys (O), 1419 Spring Garden street. H. H. Burrell (C), 206 South Quince street. Cost, \$2,000. Storage house, 1419 Spring Garden street.

William F. Read & Sons Co. (O), Twelfth and Jackson streets. H. H. Burrell (C), 206 South Quince street. Cost, \$1,000. Factory, Twelfth and Jackson streets.

John F. Davidson (O), 7002 Greene street. James H. Walters (C), 168 East Walnut lane. Cost, \$635. Garage, Sedgwick and Greene streets.

Walker & Fulsner (O), 214 South Second street. J. Gorchov (C), 4116 Girard avenue. Cost, \$500. Store, 214 South Second street.

E. A. Parker (O), 27 North Juniper street. J. Ehmann (C), 1024 Cross street. Cost, \$500. Stable, 2016 South Eleventh street.

M. Gross (O), 1414 South Nineteenth street. A. Shestack (C), 528 Reed street. Cost, \$375. Store and dwelling, 1414 South Nineteenth street.

Josephine Stirk (O), 1636 Filmore street. D. Henwood (C), 1509 Wood street. Cost, \$1,650. Store, 4740 Frankford avenue.

David Goldsmith (O), 310 Moore street. Jacob Bender (C), 1810 South Fourth street. Cost, \$2,000. Stable, 310-14 Moore street.

C. & R. Grunder (O), William Penn P. O., Pa. Cost, \$800. Milk plant, Delmar and Tibben streets.

George B. Clopp (O), 3207 Spring Garden street. Cost, \$300. Shop, 3717 Filbert street.

Effingham Perot (O), 125 South Fifth street. John Duncan (C), 920 Walnut street. Cost, \$1,200. Manufacturing building, 36 North Delaware avenue.

Baldwin Locomotive Works (O), Broad and Spring Garden streets. Armstrong & Latta (C), Land Title Building. Cost, \$10,000. Machine shop, Twenty-sixth and Pennsylvania avenue.

Frank Silver (O), 1623 North Thirteenth street. J. F. Grant (C), 1625 North Thirteenth street. Cost, \$700. Garage, 1623 North Thirteenth street.

Morris Dannenbaum (O), 930 Market street. Frank G. Stewart (C), 1619 Sansom street. Cost, \$12,300. Office and warehouse, 1017 Race street.

John C. Rausch (O), 2115 North Sixty-third street. Charles C. Pace (C), Merion, Pa. Cost, \$2,500. Garage, 2119-21 North Sixty-third street.

M. Kalvic (O), 4121 Germantown avenue. A. Zurnicke (C), 1632 Hunting Park avenue. Cost, \$3,825. Store and dwelling, 4203 Germantown avenue.

Lewis King (O), 928 Pine street. C. A. Legates (C), 322 North Gross street. Cost, \$4,500. Store and dwelling, 1122-24 Pine street.

Kugler's Restaurant (O), 1412 Chestnut street. J. F. Johnson (C), 331 North Fourth street. Cost, \$400. Restaurant, 30-36 South Fifteenth street.

T. Guexreva (O), 1141 South Ninth street. F. Palumbo (C), 521 Christian street. Cost, \$2,500. Store and dwelling, 1145 South Ninth street.

H. A. Havarth (O), 518 East Dupont street, Roxborough. John J. Hurley & Co. (C), 4416 Cresson street, Manayunk, Philadelphia. Cost, \$1,200. Store and dwelling, Pechin and Lyceum streets.

Fred Creciluis (O), Fifteenth and Wolf streets. W. Creciluis (C), 2130 Bouvier street. Cost, \$500. Store, Fifteenth and Wolf streets.

Ed. Misach (O), Forty-sixth and Brown streets. Charles G. Clark (C), Wyalusing avenue. Cost, \$300. Dwelling, Forty-sixth and Brown streets.

Sweeney Stevens (O), 2105 Tioga street. Cost, \$500. Tenement, 1906 West Tioga street.

H. C. Rumpp (O), Fifth and Cherry streets. J. Freeland Co. (C), 293 Greenpoint avenue, New York City. Cost, \$10,000. Store, Eighth and Chestnut streets.

Barrett Manufacturing Co. (O), Bermuda and Margaret streets. A. R. Raff (C), 1635 Thompson street. Cost, \$4,000. Factory, Bermuda and Margaret streets.

Taylor Watson (O), 129 North Millick street. Cost, \$800. Dwelling, 6141 Girard avenue.

COUNTRY'S BUILDING RECORD.

Fewer But More Expensive Structures Planned in January.

In the four weeks starting with the first of the year and ending January 31, 12,818 buildings were planned in 139 cities in the United States. Though this represents a considerable amount of building, January of 1915, and in fact those of 1914 and 1913, surpassed in volume the record of last month. In expenditure, however, 1916's January leads other years.

According to reports to "Bradstreet's Journal" from 139 cities, buildings planned last month will cost \$52,761,278 to erect. This total is 19.8 per cent. above 1915's and 7 per cent. more than 1914's.

The far Western States alone show a de-

crease in permits from a year ago in January, while every group but the Eastern States shows a gain in expenditure, the falling off in the middle group being accounted for by Manhattan and Bronx building showing a decline more than offsetting gains by Brooklyn and Queens boroughs.

The increase in values in the Northwest is large, 88 per cent., while the increase in New England is smallest, in this respect contrasting sharply with January a year ago, when the "munitions boom" as regards building began in New England.

Of the 139 cities reporting for January, eighty-six, or three-fifths, show gains over a year ago. New York City, four boroughs reporting, is one of the cities showing a decrease from a year ago, 117 per cent. Other large cities showing decreases in January are Boston, 25 per cent.; Pittsburgh, 26 per cent.; St. Louis, 48 per cent.; St. Paul, 39 per cent.; Portland, Ore., 55 per cent.; San Francisco, 5.8 per cent.; Baltimore, $\frac{1}{2}$ of 1 per cent.

Some of the cities showing gains are Buffalo, 34 per cent.; Jersey City, 99 per cent.; Newark, N. J., 5.7 per cent.; Philadelphia, 104 per cent.; Cleveland, 43 per cent.; Detroit, 62.6 per cent.; Chicago, 87.6 per cent.; Milwaukee, 19.5 per cent.; Minneapolis, 20.8 per cent.; Richmond, 88 per cent., and Los Angeles, 95 per cent.

FACTS ABOUT MASONRY.

Notes on Weight and Strength of Materials, Methods of Measurement in Common Use, System of Computing Loads on the Soil, Valuable for Reference to the Builder and Architect.

Stone masonry is a matter of first importance to the builder, as its conditions must be studied whatever materials are eventually used in the foundation of the building under consideration.

Here are some notes on weights and strengths of materials, and methods of measurement in common use, which are valuable for reference.

Measurements.

Stone masonry is measured by two systems. Quarryman's and mason's measurements. By the quarryman's measurements, the actual contents are measured; that is, all openings are taken out and all corners are measured single. By mason's measurements all corners and piers are doubled. No allowance is made for openings less than three by five feet, and only half the amount of openings larger than this.

Range work and cut work is measured superficially and in addition to wall measurement. An average of six bushels of sand and cement is used per perch of rubble masonry. Stone walls are measured by the perch of $24\frac{3}{4}$ cubic feet, but in practice 25 cubic feet are considered a perch of masonry. Openings less than three feet wide are counted solid,

but openings over three feet are deducted, although eighteen inches are added to the running measure for each jamb built.

Arches and Dimension Stone.

Arches are counted solid from their spring, corners of buildings are measured twice. It is customary to measure all foundations and dimension stone by the cubic foot. Water tables and base courses are measured by lineal feet. Walls are never considered to be less than eighteen inches thick. The height of brick or stone piers should not exceed twelve times their thickness at the base.

Excavations.

Excavations are measured by the cubic yard and irregular depth or surfaces are generally averaged in practice. To find the number of perches in an ordinary job multiply together the length, height and thickness in feet and divide by 22.

Concrete.

Concrete work is usually measured by the cubic yard of 27 cubic feet. One bushel of cement and two bushels of sand will cover three and one-half square yards one inch thick, and four and one-half square yards three-fourths of an inch thick.

Brick Work.

Brick work is generally measured by one thousand bricks laid in the wall. Bricks vary in size according to the locality and manufacture. An ordinary brick is $8\frac{1}{4} \times 4 \times 2$ and some are a little shorter, a little wider and a little thicker. In fact, there is no standard size. A rough rule is to calculate 22 bricks, without considering the mortar, to the cubic foot. Another method of determining the number of brick is according to the square foot face of the wall. Eight common bricks to the foot in a four-inch wall, fourteen common bricks in a nine-inch wall, twenty-two bricks in a thirteen-inch wall and twenty-eight to thirty in an eighteen-inch wall. Walls of greater thickness in the same proportion.

One and one-eighth barrels of lime, five-eighths yard of sand will lay one thousand common brick. Corners are not measured twice as in stone work. Openings over two feet square are deducted. Arches are counted from the spring. Fancy work, counted one and a half bricks for one. Pillars are measured on their face only.

Mortar.

A cubic yard of mortar requires one cubic yard of sand and nine bushels of lime. It will fill thirty hods. One thousand bricks closely stacked occupy about 56 cubic feet. The same number of old brick cleaned and loosely stacked occupy about 72 cubic feet.

Chimneys.

In chimneys five courses of brick will lay one foot in height. Six bricks in a single course will make a flue opening four inches wide and twelve inches long and eight bricks in a single course will make a flue opening eight inches wide and sixteen inches long. Unless there is a flue lining the wall of a chimney should not be less than two bricks in thickness. The safe bearing load for brick

work laid in lime mortar is estimated at one hundred pounds per square inch. Hard bricks laid in Portland cement mortar will support two hundred pounds per square inch. Granite squared in stone work, three hundred and fifty pounds, sand stone one hundred and seventy-five, rubble stone work laid in lime mortar, eighty pounds. The same laid in cement mortar, one hundred and fifty. Concrete laid one part cement, two of sand and five of broken stone, one hundred and fifty pounds. Limestone, squared stone work, 250 pounds.

Bearing Load on the Soil.

However strong a wall may be there must be a sufficient support under it, so it is necessary to consider the bearing loads which it is safe to put on the foundation soil. The hardest rock in its native bed will support one hundred tons to the square foot. Rock equal to the best Ashlar masonry, twenty-five to thirty tons; rock that is equal to the best brick will carry fifteen to twenty tons. Clay, when it is in thick beds and always dry will carry from four to six tons to the square foot; clay moderately dry, two to four tons; soft clay, one to two tons. Gravel and coarse sand well cemented by nature will carry eight to ten tons; compact sand will carry four to six tons; sand which is clean and dry, two to four tons. Quick-sand and alluvial soils are allowed one-half to a ton per square foot.—John Upton, in "Keith's Magazine."

COMPOSITION FLOORING.

How It Is Made and Why It Is Desirable.

Few persons know what composition flooring really is or why this material is more desirable in certain classes of buildings than any other floor covering. This is due in part to the comparatively recent discovery of its process of manufacture, and also to the secrecy with which the business itself has been conducted in this country.

Composition flooring, says an unidentified authority, is what might be termed a magnesium chloride cement. When commercial magnesite is mixed with a strong solution of magnesium chloride, it dries or sets in a few hours into a firm, hard mass, capable of receiving a high polish. Certain fillers and coloring matters are always added to give to the finished product attractiveness, resiliency, elasticity and other desirable qualities.

This material is laid in a plastic state and bonds directly to wood, concrete or metal. It takes its initial set in from two to six hours and may then be troweled to a very smooth and even finish. After twenty-four to thirty-six hours it may be walked upon, but it is advisable to protect it against constant and heavy traffic for at least 48 hours.

Perhaps the most striking feature about composition flooring is the fact that it is sanitary. When properly installed its surface is smooth and unabsorptive. Unlike cement or terrazzo, it will not give off dust when walked upon. A room, no matter how large, may be laid in one continuous stretch without cracks

or joints of any description. Moreover, a sanitary cove base may be readily installed with this same material so that all joints between walls and floors are germ and dirt-proof.

Composition is also fire resistive. It will successfully withstand the action of heat to a temperature of from 1,500 to 1,800 degrees F.; at a higher temperature it will not burn, but will crack or burst, due to the formation of steam from the water which remains after the setting process is complete.

The resiliency of a composition floor depends largely upon the fillers used in its manufacture and the method of its installation. It should be added, however, that a highly resilient floor is not necessarily, or even generally, one which possesses a soft or penetrable surface. Composition ranks high among the standard flooring materials in both crushing and tensile strength. Some composition floorings laid $\frac{1}{2}$ inch thick showed that its ultimate crushing strength was approximately 10,000 pounds a square inch. Its tensile strength is about 600 pounds a square inch.

Composition is inherently a non-slippery floor covering. It can be mixed and laid in such a manner that even on steep inclines there will be no danger of persons slipping or injuring themselves. It weighs less than 4 pounds a square foot after setting is complete. For that reason it is often used in old buildings where the supports to the floor are not strong. It is not absolutely waterproof, but shows an absorption of about 2 per cent. after 48 hours of immersion in water. Thereafter, it will gradually take on more water, and in time will soften to a point of disintegration. It is advisable, therefore, never to use composition where water is to remain on the floor for more than a few hours at a time, or where the foundation is damp or is likely to become damp.

NEW YORK A BILLION DOLLAR FLAT CITY.

Every day new evidence of the greatness of New York is coming to light, says the New York "Sun." In so many ways is the city superior to others that this information no longer creates surprise. There was a look of wonderment, however, on the faces of the real estate men who attended last week the dinner of the New York Building Managers' Association at the Machinery Club when Tenement House Commissioner Murphy said that the cost of tenements erected since the tenement house law came into effect thirteen years ago was \$1,100,000,000, a fabulous figure. There are in New York, Commissioner Murphy explained, about 104,000 tenement houses, of which 78,000 are of the type erected before the law came into effect. This kind of buildings is disappearing at the rate of 1,000 a year.

The group of multifamily houses erected last year will provide accommodations for 150,000 persons. The Bronx led in the number of apartments erected, but in cost Manhattan was supreme, due to the many apart-

ment structures of the highest type which were erected here. Though the tenement house law has tended to increase congestion, Mr. Murphy explained that the law had improved the conditions of homes and that today people are living in more sanitary and healthful apartments than when the city was less congested.

"The law has done for housing conditions in New York what the pure food law has done toward safeguarding the health of the people," he explained. Mr. Murphy thought that when the transit lines now under construction are in operation there might be a distributing movement which would relieve the parent borough of some of its congestion, which he attributed to limited public facilities in the past.

There is enough land in New York, he said, with the parks and water bodies taken out, to give every family of five persons a plot 50x100 to build a home on. Mr. Murphy said that zoning of the city, which might work a hardship in some cases, was a good thing for the city at large. The question of equities should have received attention long ago, it being a maxim of law that the equity of a neighbor should not be impaired. Tall structures, he said, have often had no good effect on the improvement of the remainder of a block. The principle of ancient lights so long observed and enforced in London should have long ago been on the statute books of New York, he implied.

Proposals

Bonds. Improvements. Equipment.

At the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 17, 1916.—Sealed proposals will be opened in this office at 3 P. M., March 30, 1916, for the construction complete of the United States post office at Huntingdon, Ind. Drawings and specifications may be obtained from the custodian at Huntingdon, Ind., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 23, 1916.—Sealed proposals will be opened in this office at 3 P. M. March 27, 1916, for a conduit and wiring system and lighting fixtures for the pure food and drug laboratories, at the United States appraiser's stores, New York, N. Y., in accordance with drawings and specifications, copies of which may be had at this office or at the office of the Supervising Chief Engineer, U. S. Customhouse, New York, N. Y., in the discretion of the Supervising Architect. O. Wenderoth, Supervising Architect.

ANCHOR POST FENCES

are not the ordinary kind—they are fences of heavy galvanized netting erected on Anchor Posts—posts which won't sag or get out of line, and are galvanized both above and below ground to prevent rust.

In addition to fences and iron railings and gates of every kind we make tennis court, chicken-run and kennel-yard enclosures.

The Standard Documents of the American Institute of Architects

The New Contract Documents of the American Institute of Architects are now on sale and replace the old Uniform Contract, which is to be discontinued

PRICES FOR SINGLE COPIES

Agreement and General Conditions in cover	\$.10
Bond of Suretyship	.02
Form of Subcontract	.02
Letter of Acceptance of Subcontractor's Proposal	.01
Complete set in cover	.15

Trial set delivered upon receipt of nine 2-cent stamps.

These Documents have received the full approval of the Institute, through its Convention, Board of Directors and Officers. They are the outcome of nine years of continuous work by a Standing Committee on Contracts and Specifications. This Committee, comprising some of the ablest American architects, was assisted by the Institute's forty Chapters; advised by eminent legal specialists in contract law and aided by representatives of the Building Trade Associations of the United States. The forms have been officially approved by the National Association of Builders' Exchanges, the National Association of Master Plumbers, and the National Association of Steam and Hot Water Fitters.

The INAUDIO

Absolutely Noiseless Closet Combination.

Substantial as a Closet. Can be made noiseless in operation.

Thoroughly vitreous.

The special feature is the refill chamber, giving perfect water seal, thus preventing the escape of gases.

Why continue to handle the ordinary closet combination when the INAUDIO costs no more to install, is positively quiet in operation, and has many other superior advantages?

Without energetic effort a man must remain in a rut and can never expect to share with his hustling, up-to-date competitor. Quoting the words of a gifted scribe: "Health attends the man who acts. Wisdom guides him. Hope frees him. Joy helps him. Power moves him. Progress marks him. Fame follows him. Wealth rewards him. Love chooses him. Fate obeys him. God blesses him. Immortality crowns him."

Editorial Comment

Building prosperity in Philadelphia shows no sign of abatement. According to statistics vouched for by the Bureau of Building Inspection, we are entering upon what promises to be another record year in building activity. While the number of permits issued during January and February is fewer than during the corresponding months of 1915, the increase in the cost of operations is about \$1,000,000 over last year.

February of 1906 was the best February in ten years, with a total of more than \$3,000,000 expended. February of 1915 was the second best, with an expenditure of \$2,600,000. February of 1916 is a good third, with a total of \$2,437,750.

Admitting that a considerable percentage of this increase is due to the advance in price of building materials, the volume of prospective work in the architects' offices, considered in connection with the amount of actual new work on the builders' boards, goes to show that 1916 is destined to maintain Philadelphia's recognized supremacy as a building center.

* * *

At a recent meeting, held in New York City, the avowed object of which was to discuss means for "bringing art closer to the people," opinions were expressed by men of prominence in the arts that are disconcerting to say the least. Cass Gilbert, the noted architect, who was one of the speakers, defended vigorously the poor man's appreciation of art and incidentally took a decided fling at art as exemplified by the Federal Commission.

"The Government has spent \$500,000,000 on what was classed as art. The work was done without expert advice, and the result is that the work is contemptible. You can't build artistic Government buildings with a rubber stamp."

Then came Cabot Ward, and, in closing his remarks he thundered:

"City Hall Park would resemble a corner of Woodlawn Cemetery if every one who wanted to was allowed to put a monument there."

The only neutral was William T. Evans, chairman of the Art Committee of the Lotos Club.

"Art museums are better than hospitals," he said. "Hospitals make sick men well. Museums make well men better. Art is a luxury for the rich and a necessity for the poor."

* * *

Few of the speakers agreed, as the brief excerpts from their addresses here reprinted go to show:

"The American people have less regard and appreciation for art than any other people."—Edward F. Cragin, president of the New York Finance and Securities Company.

"Americans are great lovers of beauty and take the greatest interest in art."—Edward Robinson, director of Metropolitan Museum.

"The poor people are kept away from art and misled by the mediocre and poor works of art in the parks of the city—some of them are monstrosities."—Cabot Ward, Park Commissioner.

"I do not know of any country which appreciates art like America, and I lived in Paris ten years. Every child in America is familiar with art through the magazines and newspapers."—A. A. Anderson, artist.

"Persons who live in dark rooms cannot appreciate art."—Grosvenor Atterbury.

"The museum is the poor man's gallery, and 90 per cent. of those who use the museum have less than the average income."—Cass Gilbert, architect.

* * *

By way of rejoinder to this clattering of individual opinion, we can think of nothing more appropriate than a few paragraphs from a talk delivered by Joseph T. Pearson, winner of the \$1,000 Stotesbury prize and the Temple gold medal, at the Academy of the Fine Arts on Thursday of last week. Said Mr. Pearson:

"As the artists have cut their hair and shortened their ties, so I would abbreviate all reference to art. Let us have less talk regarding art and more art.

"Remember, art is the song of a people's heart, and songs with heart in them make glad the world.

"From the time that man emerges from this earth until he is returned to it, he is the centre of contending forces of good and ill. The cold threatens him and he is warmed. Hunger seizes him and he is fed. Darkness endangers him and his way is lighted. Ignorance would destroy him and he is educated. Through manifold influences, positive and negative, he stumbles on until the end seizes him unawares.

"If one could set down the story of the humblest life from childhood to old age, fully and perfectly, there would be no need of art. All would have been said. But man remains an enigma and the science of his revelation is art.

"Artists are the official interpreters of life. They are of the people and are responsible to the people. The people you see are really the artists, and the artists but their implements. The artist is part of a great social scheme. He is not his own master; he is responsible to his fellows. Approval or disapproval comes from them, and their judgment is final and right. The real artist understands this, and he labors in plain view of his fellows—in the open—without subterfuge. He faces the truth boldly and affectionately, and men love him and cherish his memory.

"The artist plays a part now great, now small in the life of the people. He is a wel-

come member of the company when he is good and unwelcome when he is bad. Does the company know whether he is good or bad? Yes. Its judgment is as sure as fate. The artist himself cannot be depended upon to know. He quite naturally cannot see himself. He must be advised. So now we have it. The artist is a good or bad actor in a large company which establishes his reputation by inevitable laws which he will call public opinion."

* * *

Gutzon Borglum, the noted sculptor, who has been engaged to convert Stone Mountain, near Atlanta, into a mammoth and everlasting memorial of the Confederacy, has just made public his plans for the vast monument.

The outline of his plans may be prefaced by the statement that the movement to establish such a memorial is the work of the United Daughters of the Confederacy. Stone Mountain is a vast block of granite about 12 miles from Atlanta. It is one mile from base to summit upon its approachable side. The other side is a perpendicular plane some 700 feet high and several thousand feet long. It is upon the face of this plane, which may be seen for miles, that Mr. Borglum plans to carve the figures which will form the memorial.

He has outlined his plan as follows:

"The plans which I have developed, and which have received almost national approval, contemplate a large central group, located about midway toward the top, and includes five to seven equestrian figures representing Lee, Davis, Jackson and such other members among the general commanding officers as the committee may designate. Back of this group, about 200 feet, will appear a larger group of mounted general officers, portraits of such men as the committee may designate. To the east and on the face of the mountain, slightly above and to the right of Lee, will appear a section of the army coming down over the mountain and will contain infantry, cavalry and artillery.

"Directly under the central group at the base of the mountain I have planned to create within the mountain side a memorial hall, dedicated to the women of the Confederacy. This hall will be lighted by windows to the number of Confederate States, and when done will be dedicated to the Daughters of the Confederacy, to be placed in their custody forever. The gift of the property and documents covering the transaction, arrange for the final possession of the memorial by the State of Georgia.

"My plans are such that the work can be begun within a few months, and the main central group will be the first to be undertaken. When this is completed the great hall below will be finished next. It is my determination that the two parts of the general plan shall be completed within the next three years, and it may be possible to do it in less.

"Arrangements are also under way for the building of the studio directly opposite the

mountain, and in front of the work to be carried out. This studio will be a permanent building of granite, where all the models for the work will be made. The work itself will be done from scaffolding suspended from the top of the mountain."

* * *

In connection with the New York "Sun's" competition for plans for a house to cost not more than \$4,500, full details concerning which were printed in last week's "Guide," we are moved to note a letter the "Sun" publishes from a land developer interested in the outcome of the contest.

"Our people," he writes, "have been so fed up on high class architecture that though they are able to spend say \$7,000 on their homes they demand as much of the artistic as the man who can afford to pay much more. That is as it should be. I do not believe that attractiveness and comfort should be reserved for those alone who can pay high prices for them. It is the right of every man who spends his money on a home to demand an economically, artistically planned, durable building.

"If we had more men who could plan attractive, low priced houses we would have more home owners. Many people will not buy to-day because they cannot find satisfactory houses for prices they are willing to pay. These people do not want everything for nothing, but they do demand well planned houses."

Another land promoter who is watching the competition with keen interest expresses the conviction that the architects who have a solution for the moderate priced home problem need not worry about the future for their field is practically the entire country.

* * *

That the city's failure to keep pace with improvements made by private enterprise holds back development was brought to the attention of Philadelphia's Mayor recently by a delegation of operative builders, headed by the president of their association, Harry Brocklehurst.

The builders pointed out to the Mayor a condition which has existed years—the failure of the city to extend main and branch sewers into territory where development waits only for their construction. They asked that money for this purpose be included in the next loan to be submitted for the approval of the city's voters, at the same time calling attention to the fact that the builders of Philadelphia added about \$40,000,000 to the taxable value of Philadelphia's real estate last year.

It came out in the discussion of the matter that sewers, involving an outlay of about \$300,000, have been planned, but their construction is held up, because there is no money available to build them.

In times past builders have put in sewers under the supervision of the city, paying the cost of construction themselves, and awaiting the sale of the houses they build to reimburse themselves for the outlay. The cost of sewer construction is apportioned pro rata,

according to frontage, among the houses, this charge being a first lien against each property, regardless of whether the sewer has been built by the city or by the builder. It is the opinion of the builders, however, that they should be relieved by the city of the necessity of constructing sewers, and that some effort should be made by the municipality to keep pace with improvements without private aid.

MORE OR LESS PERSONAL.

**G. Edward Brumbaugh, son of Governor Martin G. Brumbaugh, has opened an office for the practice of architecture at 1224 Real Estate Trust Building, and will be pleased to receive samples and literature.

**The Steward & Stevens Iron Works has purchased additional properties at 1718, 1720, 1722 North Ninth street for yard space, crane sheds, etc., enlarging their facilities for structural iron work. The firm reports an immense increase in its business.

TO LIMIT TALL BUILDINGS.

The tentative plans of the new Building District Commission of New York City, as far as they have become known, seem to have as their first object the future elimination of tall buildings. A conference among property owners, real estate men and city officials was recently held in that city, at which the plans were discussed and at which it seemed to be the consensus of opinion that the limitation of the heights of buildings and districting of the city into zones will do much to stabilize property values, while proper city planning will accomplish a great deal of good for general real estate conditions. In this manner the shifting of property values will be prevented.

With respect to the limitation of the heights of buildings, the building experience in New York has conclusively demonstrated that the erection of mammoth buildings causes adjacent property to depreciate in value and deprives the smaller buildings of tenants. Unrestricted building has been detrimental to both small and large property owners, so that if real estate owners will not conserve their own interests by moderation, it is necessary that, in the interests of the community as a whole, certain restrictions be established.

Advertise and the world buys of you;
Renig, and you need a loan.
If you never tell what you have to sell,
You'll have troubles all your own.
— 'Los Angeles Evening Herald.'

American Ice Co. (O), Sixth and Arch streets. Clark Paving Co. (C), Forty-eighth and Woodland avenue. Cost, \$540. Wall, Fifty-third and Whitby avenue.

H. J. Rittenhouse (O), Fifty-third and Vine

streets. James M. Holm (C), 5556 Arch street. Cost, \$3,000. Store and dwelling, 647 South Sixtieth street.

Blauners, Inc. (O), 833 Market street. Fleischmann Const. Co. (C), 11 West Forty-fifth street, New York City. Cost, \$75,000. Store, 833 Market street.

G. Leonardi (O), 1847 Sartaire street. Alfonso Peli (C), 1209 South Thirteenth street. Cost, \$360. Dwelling, 1847 Sartaire street.

James McWinamon (O), northwest corner Twenty-third and Fairmount avenue. John Welsh (C), 738 North Seventeenth street. Saloon and dwelling, Twenty-third and Fairmount avenue.

WHEN THE WAR IS OVER—WHAT?

Current Events Portend a Continuous Construction Period—Reasons Why Building Prosperity Is Felt

Construction in 1916 and 1917 promises to be without parallel. Finance, credit and the remarkable condition of the building material market prove the presence of prosperity. The improving demand for rentable space establishes its foundation, and the most gratifying feature about it is that it is general and not merely local.

The story of the depression existing prior to August of this year is too well known. Few realize what has been happening in the last five months. From January 1, until the huge credit of half a billion dollars was established in this country for the Allies, practically every industry associated with building construction was being operated on reactionary bases. Whether the extension of credit to America's biggest customer was ethically or morally right or wrong, the fact remains that August showed a resumption of 13.7 per cent. over plan lings for August of a year ago, September showed a gain of 30.5 per cent. over the same month last year, October developed a gain of 37.9 per cent. over the identical month of 1914 and November developed a gain of 55.5 per cent. in national plan filings. In each case New York showed improvement.

There is not the slightest doubt that the initial impetus to the improvements in national building construction was due to the demand on the part of mills catering to war supplies for more room. The city of Bridgeport, Conn., added 22,000 skilled artisans to its population in a few months and erected under forced conditions new factory buildings aggregating almost \$3,000,000 in value. This is only one typical New England manufacturing city.

It is estimated that \$2,000,000,000 has been paid out in wages and additional building costs, machinery and supplies directly traceable to war munitions and manufacture of equipment since January, 1915. This money has passed through the hands of a large percentage of the 16,613 architects, 174,422 build-

ers and building contractors, 135,000 electricians and electrical contractors, 14,514 mechanical engineers, 52,033 civil engineers and 17,000 building material manufacturers, making a general distribution of 409,382 employers, who, after taking their profits, have passed a liberal share on to labor, which has been accorded higher wages and shorter hours.

Normal national value of annual production of building materials exclusive of equipment totals \$1,495,544,120. Government authorities estimate that this year's total will be extended to \$2,500,000,000, at least.

If that fact develops, it will be easy to see why there is a mill shortage of building materials at this time. This demand, as has been stated, began only in August. Prior to that period every manufacturer was suffering from shaded prices and keen competition. Sick of the routine work of making standard building commodities for little or no profit, they reduced expenses by shutting down their capacities from thirty to seventy-five per cent.

Labor is better employed than it has been in seven years. There is an actual shortage of unskilled labor. The salaried staffs of large corporations released because of the depression in many lines a half year ago are now in employment. New help has been taken on. Savings bank accounts are being added to instead of being withdrawn. This has released money for building mortgages and building operations.

The Bigger Side.

But there is a bigger side to it, namely, that relating to large mercantile expansion and its ultimate effect upon building demand.

There is not the slightest question but that renting conditions are improving in all the leading cities. Here in New York there is a demand for loft and office space that is changing the policies of renting agents. Concessions are not now so easy to obtain. Firms that closed their offices and took their executive departments to out-of-town mills to

cut down expenses are opening in New York again, and in many cases are taking larger space. Idle space in the old wholesale district is being taken up by manufacturers as storage places to make way for munition work that brings a high immediate profit. The stored goods awaiting order here will avoid risk of railroad cluttering next spring or after the war.

Every contractor and building material interest is wondering what effect a sudden termination of the war will mean. Conjecture is running rampant. Some predict panic. Others predict retraction. Others confidently look for uninterrupted prosperity.

Based upon economic cycles, we are in line for at least the usual seven fat years following seven lean ones. But placing prognostication upon more concrete material it might be stated that the saving factor and the most positive agent in assuring permanence of prosperity is that few lines are over-produced. Here was the danger in 1909, and it was the stumbling for the embryonic prosperity of early 1912. Everybody had an abundance of manufactured materials and were ready to sell them at a discount.

Optimism the Rule.

To-day the opposite is the rule. Nobody, either now or after the war ends, should peace be declared between now and August, can or will be able to afford to sell even at basic prices ruling in 1912. It will not be possible to manufacture to excess because labor is already too scarce. The objection that the termination of the war will release large numbers of mill hands is set at naught by the fact that all war contracts are taken for a given number of years, mostly three, regardless of whether the war continues or not, and upon the termination of these contracts the United States Government will take care of war munitions output for a number of years in line with its pledged preparedness program. Imports will be offset by an increased export business in lines, notably cement, magnesite block, special building hardware, steel, iron and other products, thus keeping up a demand for commodities at home, especially if there is suitable tariff protection enacted to help insure our own industrial welfare.

Machinery the Keystone.

The national keystone in the arch of prosperity is machinery. It holds full control of the future industrial welfare of this country. Every machine shop of consequence has its capacity taken up to varying months in 1917. The manufacturer who would attempt to put in labor-saving machinery this year will find it almost impossible to get the equipment he wants. This will keep his output low, prices high and labor well employed.

With this condition obtaining there is no need for worrying about the permanency of the growing prosperity. It does not hinge upon the war. It centers, more than upon any other thing, on the enactment of the \$1,230,000,000 preparedness program, the passage of a suitable merchant marine bill and proper protection for American industries against

the dumping by Europe upon our shores of unmarketable products that have been in storage since the war began.

The inflow of gold is not likely to stop even after the war ends. But America is now not independent upon that avenue of financial sustenance. Foreign credits are excellent. They have helped to bolster up conditions here, but the weight of responsibility for future prosperity and future good building conditions centers upon our success in obtaining an export market for our own products. If we are to have an adequate merchant marine our prosperity is permanently assured.

Financiers who are in position to know say that money has been made as fast in the last seven months in financial circles as it was lost earlier in the year and immediately following the outbreak of the war. This means a good demand for securities. A good demand for securities means a healthy mortgage market. High mortgage rates attract capital and mean that commercial and residential renting space is in good demand, and when that is the case building proceeds at a pace that considers neither the high cost of materials, the ascending price of realty, but only the finished structure with prosperous tenants within.—“New York Real Estate Record.”

BUILDING CODES HERE AND ABROAD.

The recent publication in Scotland of what is there popularly termed “a national building code” serves to illustrate how different from the American idea is the conception in other lands of what a building code should be. In the notices of the work which have appeared in the Scottish press doubt is innocently expressed if anything quite so ambitious in relation to building has been previously attempted on a national scale in any country. On examination this Scottish national building code is found to be entitled, “Regulations for entering into and carrying out contracts for building works in Scotland, together with general conditions of contract and form of contract.” Its stated object is to ensure uniformity of practice in entering into and carrying out contracts for building works from the preparation of the schedule of quantities on which the contractor's tender is based to the payment of the final balance. It does not, this code, undertake to direct, as our codes do, the manner in which buildings shall be constructed, as it does not have the status or possess the force of parliamentary law, being the product merely of a convention composed of members of the national architectural and building societies.

A prefatory note by Sir G. R. Askwith, who was the chairman of the convention, explains that these “general conditions” of contract for ordinary use have been drafted upon the basis that it is essential to provide (1) that the drawings and specifications shall represent the work to be contracted for and shall not be taken merely as showing what is at present contemplated or intended, subject to such modifications and alterations as may be hereafter made; and (2) that the sum

which shall become due to the contractor on completing the works embodied in such drawings and specifications shall be fixed as far as practicable before the contract is entered into.

The architects and builders of Scotland evidently live in a little world all their own, with their building laws and practices in a primitive state. Scotland, with only half the population of the State of New York, of course never heard of our State codes for regulating the construction of tenements, factories and mercantile buildings. It seems that in Scotland they are trying to establish what is and has been from time immemorial, the practice in America on contract work. The drawings and specifications have always, with us, been the basis of the contract, which has invariably specified either the lump sum or the percentage above cost, which the contractor is to receive for his work. On the authority of a British contemporary, it can be said that the secret of the trouble they have been having in Scotland over the performance of building contracts springs out of their practice of making bills of quantities or measurers' schedules part of the contract, because too often the computations are inaccurate.

But such matters as these have no part in a real building code. Two eminent examples of the American idea of the function of a general building code have been recently produced here, one being the official New York City code, of which R. P. Miller, C. E., was chief editor, and the other the model code of the National Board of Fire Underwriters, of which Prof. Woolson was the chief editor. Neither considers it necessary to attempt a regulation of matters so well settled as forms of contract, and confines itself solely to rules for sale and good construction, a course which the codes of our principal American cities have always persisted in and which has resulted finally in the highest perfection of building laws as well as of building construction.

A dinner in Mr. Miller's honor given by the joint committee on City Departments recently was a pleasant celebration of the successful completion of the new revision of the New York City code, and a proper recognition of a meritorious public service.—“Record and Guide.”

COMPETITIONS FOR PRIZES OF ROME FOR THE PRESENT YEAR.

The American Academy in Rome announces its annual competitions for the Prizes of Rome in architecture, painting, and sculpture, which take place annually. The next competition in landscape architecture takes place in 1918. The awards are made on competitions which are open to all unmarried men, citizens of the United States, without age limit, who fulfill the requirements and agree to comply with all regulations. Applications must be filed not later than March 1, together with such letters of reference and other documents or evidence of ability as applicants may desire to submit. The stipend of each Fellow will be \$1,000 a year for three years. The

preliminary circular of the Academy may be had from the secretary, C. Grant La Farge, 101 Park avenue, New York, giving all the general and special regulations and blanks for applications.

IMPROVING HOME GROUNDS.

Make your home surroundings beautiful by following the laws of order and simplicity is the keynote of a bulletin on home grounds which has just been published by the New York State College of Agriculture at Cornell.

Beautiful grounds may be obtained without a lavish expenditure of money and without a sacrifice of convenience. Since the house is the centre of all home activities, too much attention cannot be given to its location. If possible, the house should be set slightly above the land immediately surrounding it, but not too high; see that the view from the windows of the rooms most used are the best ones to be obtained from your particular location.

Select your type of house with a view to making it fit in with its surroundings. A smoothly graded lawn is more easily mowed, as well as more beautiful. Lawns should be kept clear of flower beds and also of many single trees and shrubs. A little planting along a house, some large trees, with most of the plantings along the boundaries, looks best. Unsightly objects that are necessary may be covered up with planting.

Do not chop up your grounds with paths, says the bulletin. Lay out walks with a purpose, that purpose being to make them lead somewhere, without cutting across a grass plot or spoiling the general appearance of a lawn, and then make them beautiful with shrubs and trees that lend themselves to such uses. Oftentimes these shrubs and trees may be of a fruit-bearing type, thus serving a two-fold purpose.

In the bulletin published by the landscape authorities of the college of agriculture are diagrams showing the proper arrangement of home grounds in relation to the house and outbuildings, and a classified list of trees, shrubs, and flowers. A general description of each plant and tree is given, from which selections can be made with an intelligent conception of the general appearance of the tree or plant, its height, its foliage, its blossoms, if it has any, and its habits.

A copy of this bulletin may be obtained by any resident of the State on application to the New York State College of Agriculture, at Ithaca, N. Y.

HOW CAN ENGINEERS BEST UTILIZE THE TECHNICAL JOURNALS?

That we cannot keep abreast of the times without reading the engineering journals is obvious. That if we carefully read all the engineering journals in our chosen specialty we would have no time left to earn a living is easily capable of demonstration. What then is the proper attitude to adopt toward this ever increasing flood of information that pours in upon us so relentlessly, week after

week, month after month, and year after year?

What shall the reader do with his special selection, from his technical journal, when once he thinks he has separated them from the flood of raw material?

Several courses are open to him:

1. He may rely on his memory and the published index to his bound volumes.

It is safe to say, however, that few engineers really make much practical use of this method. The intervening index and the bother of a search following, prove to be discouraging to that degree that a proposed reference search is abandoned in about one-half the suggested attempts. The ideal filing system is the one in which, with the least amount of effort, one can put his hand immediately and accurately on the thing itself, be it a book, a pamphlet, or a data sheet.

2. He may keep a special card index of important data, and reference to valuable articles. This at once involves labor and attention, which few busy men can give, and which, if done by assistants or librarians, largely loses its personal value to the one who needs it. The same objection as to the discouraging effect of intervening indexes holds good here, too, and it is further safe to say that of all the contrivances for indexing, the most difficult to readily handle and rapidly examine is the card index system.

3. He may abstract important data in a limited way on loose leaf transparent paper, standard letter size, and he may remove or detach articles of special value from out his journals, to be filed in regular office file system, like correspondence.

The writer has tried all of the above methods at considerable cost in time and patience, and has, for many years, settled upon the third method above outlined. With all its admitted limitations it seems to be the best for an office which is expected to find out information on a great variety of subjects in a limited time, and with the least amount of effort.

Some description of its practical workings may be of interest here.

All the technical papers of the office pass on to the desk of the head of the office and are at least looked over (not read) by him. Articles important to his particular specialty are checked with pencil, and articles of especial interest are looked over with care and double checked. Once in a long while data important enough to go to the data file is noted. This is either especially abstracted by the stenographer, or, if a diagram or cost data, perhaps traced in the drafting room; all on transparent paper for copying purposes. Special data of this kind on 8½x11 inch sheets is filed in the office data file (a separate but common standard correspondence file). From the data file loose leaf working notebooks are made up from blue prints for office or travel purposes. They are altered, refilled, amended, and sorted back from time to time as needed to keep them of usable volume and usefully up to date.—John W. Alvord before the Federation of Trade Press Associations.

SOME THOUGHTS ON SAFETY FIRST.

A ladder is one of the most dangerous things in the world.—A. E. Davidson.

The stigma resulting from carelessness clings to the official as well as the men.—George Shepherd.

All danger places must be made foolproof if the greatest percentage of accidents is to be eliminated.—J. D. James.

A thoroughly organized and drilled private fire department is an invaluable and indispensable aid in a campaign fire prevention and protection.—L. A. Phelps.

Show your employees that safety activity is in their interest. Once they realize this they will say, "This business is my business; I would like your co-operation."—Alexander Shane.

The bonus system is a powerful lever in making the men apply themselves more diligently and with intenser interest to the prevention of fire.—J. B. Ayres.

Children are not the only ones who play with fire. We live in houses veneered both inside and out. Looks count more than trinsic worth.—Dr. H. C. Campbell.

A man not confident of his ability to get out of the building in case of fire gets beyond control does not usually make the best of fire fighters.—J. E. Latta.

Two-thirds of the reduction in the number of accidents has been accomplished through organization and education, through teaching the workmen and securing their co-operation.—C. M. Price.

Do you get "The Guide" regularly? You should. Better subscribe now, while you think of it, and keep in touch. The man who fails to get and to read carefully the trade paper of his chosen line, is missing a while lot of valuable data that should be at his command.

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., February 23, 1916.—Sealed proposals will be opened in this office at 3 P. M. March 27, 1916, for a conduit and wiring system and lighting fixtures for the pure food and drug laboratories, at the United States appraiser's stores, New York, N. Y., in accordance with drawings and specifications, copies of which may be had at this office or at the office of the Supervising Chief Engineer, U. S. Customhouse, New York, N. Y., in the discretion of the Supervising Architect. O. Wenderoth, Supervising Architect.

TRADE **ECONO** MARK
EXPANDED METAL

"ECONO" expanded metal is furnished in meshes like the one illustrated above for reinforcing concrete floors and roofs, sewers, bridges, bridge floors, culverts, conduits, tanks, etc.

The meshes for this purpose are 3 and 2 1/4 inches wide. We are also in position to furnish a special mesh 5 1/4 inches by 12 inches for use in reinforcing concrete roads and pavements.

"ECONO" expanded metal is furnished in 1/2, 3/4 and 1 1/2 inch meshes for use as machine guards, screens, etc.

The 1 1/2 inch mesh is frequently used for partitioning off a portion of floor space for use as stock or tool rooms. It makes a solid partition but at the same time does not obstruct the passage of light and air.

WE CARRY A COMPLETE LINE OF ALL KINDS OF EXPANDED METAL

Editorial Comment

How important it is that the architect, selected to design and plan a great modern office building, should be a man with some experience in this branch of construction is shown by a writer in the New York "Real Estate Record," who approaches his subject from the viewpoint of the owner and renting manager.

"In a modern office building there are so many different elements which enter into the construction that each part of the building must be considered with particular care," says the article in question. "Each element of construction is represented in the market by different types of material and manufacture, and unless such element is wisely selected, a project which figures well before construction may afford a poor return on the investment in the completed building.

"In making up preliminary figures for a prospective building, real estate operators as a rule include maintenance, repairs and depreciation charges as well as interest, promotion charges and operating expenses. The three latter items are fixed in proportion to the total expense of the building. Maintenance, repairs and depreciation charges vary materially with different types of construction.

"Real estate operators, in considering the construction of a new office or commercial building, have in mind certain points which to them indicate the probable success or failure of such an operation. In the first place, the proportion of rentable space to lot area is one feature which determines the success of the venture. If the rentable area is too small in proportion to the size of the lot, the income of the building will not pay the proper dividends on the investment. The amount of space consumed by corridors, elevators or public rooms, is, of course, the important factor in determining the relation of rentable area to lot size.

* * *

"Questions of construction or of materials entering into the building, and all general details, are usually left to the architect, but it is also advisable," in the opinion of the writer, "for the owners and real estate operators to be sufficiently conversant with the various types of materials, so as to recognize the relative value of the different types of construction.

"It is not the first cost in a building that counts in its ultimate success so much as the continual expense of maintenance and repair. For example, in a certain large office building certain plumbing fixtures were used which were considerably more expensive than any of the competitive fixtures proposed. The owners have justified the extra expense by the fact that not one cent has been spent for plumbing repairs for a period extending over a number of years. In another building be-

longing to the same owners where plumbing fixtures of a less expensive type were installed, there is a continual open account for plumbing repairs. It is not just to assume that in every case it is necessary to obtain the most expensive article nor that the highest price is an insurance against defects, but the above illustration will serve to indicate that after careful examination and comparison of expenses in other buildings the owners did exercise good judgment in selecting the fixtures they had installed.

* * *

"So it is with the heating installation. A battery of boilers—that is two or three boilers set up side by side—while consuming more space in the lower part of the building, is more efficient in operation, presents a flexible heating unit, and provides insurance against failure of the entire plant in extreme weather. For example, where one boiler could easily accomplish the work desired, it is more advisable to take two boilers of a smaller size with an aggregate heating capacity as may be required, these two boilers being arranged so that in mild weather one only may be used, and in extreme weather both may be operated. The life of the boilers in such an installation is longer than is the life of the single boiler previously referred to.

"This statement, of course, is true within certain limits. Where boilers are installed of a radiating capacity, say, less than 4,000 feet, it would be absurd to put two small boilers in place of one, but from this point upward it may be assumed with reasonable accuracy that a battery of two or more boilers is well worth considering.

"The first cost of some of the special vacuum heating or vapor systems seems to the average investor as being prohibitive in a commercial enterprise. Investigation into the relative merits of a gravity system, vacuum system or a vapor system, however, might readily show that the saving in coal consumption and the saving in operating expense of the boiler plant would be sufficiently great to represent good interest on the additional investment.

"An analysis of the various kinds of structural elements such as concrete, terra cotta, plaster blocks or metal partition, is of sufficient importance to be well worth while in the case of a proposed building. The principal consideration, however, by which the relative value of types of construction should be judged is stability; and in this connection the quality of permanence would also enter."

* * *

Without entering into any criticism of the views here expressed, we want to say that while much may undoubtedly be said upon the subject of the importance of so planning and equipping an office building as to sensi-

bly enhance its renting possibilities, over-emphasis on this score is likely to produce buildings that are architecturally ugly and unprepossessing. The average building manager is so intent upon interior requirements that he is likely to overlook, if not slight entirely, the exterior qualities of the work in hand. There is a happy medium, of course, between the extremes here mentioned, and it is this happy medium the architect should seek. A building planned as to interior so as to incorporate every idea of the building or renting manager does not in every instance yield itself to attractive exterior design.

One point made by the writer, in which builders will find it easy to concur, is the wisdom of installing high, rather than low priced equipment. Equipment, generally speaking, should be selected with a view to maintenance and wearing capacity rather than first cost. The policy that demands quality at the outset makes for economy in the end, as every owner who has had any experience with repair and renewal costs has reason to know.

* * *

The zone system, for the protection of certain classes of property against the deterioration of values which results from the invasion of objectionable types of construction, is gradually coming in for a wide measure of discussion. This system, well known and long established abroad, is comparatively new to the United States, where, in general, it is but little understood. A paper, read by George B. Ford before the New Jersey Housing Conference, affords a fairly clear and lucid idea of what is sought to be achieved by this system of zones or districts.

"A man takes his savings and buys a plot of land in a residential district and builds on it a house for his own use," says Mr. Ford. "After he has lived there a year or two someone comes along and buys the plot adjoining and erects a factory on it. The man who built the residence finds his home spoiled, and in desperation tries to sell his place and move out. He discovers that the value of his property has been materially reduced.

"Again, a man builds a good house for himself, on a plot 50x100 feet, in a restricted residential area. After he has been there a few years the restrictions run out. On the plot next door to him, say to the south, there is erected a six-story apartment house. Most of his sunlight and a great deal of his light and air has been cut off. The value of his property has markedly depreciated. Both of these are typical cases happening constantly in every city and town.

"Districting according to use would save the first man. Districting according to height and area of buildings would save the second man. In other words, to avoid the harmful incursion of factories, the region in which the first man's house is located should be fixed as an exclusively residential district, or possibly a district with stores too for local trade only.

"The quarter in which the second man lives might have had a height and area dis-

trict imposed on it which would have made it poor business to erect anything except high-class residences in the neighborhood. Districting based on the social and economic needs of each part of a city or town will conserve that which should be conserved. It stabilizes property development, and conserves realty values. It helps a man's own property as well as that of his neighbor.

* * *

"Districting does away with much of the feeling that a man always has when he is buying property, that he has got to take a gambler's chance, that property around him, over which he has no control, is not going to be developed in such a way as to harm him. It preserves that which is good in existing developments and makes it far easier to predetermine the character of the development in those portions of the city which are yet to be built up. It also makes it possible for us to decide what type of housing is most advantageous under various conditions of land values, topography and distance from the center of the town.

"In other words, it should be determined what type of housing is economically and socially right in a district, then impose on that district local restrictions which will make the development of the desired type inevitable."

* * *

New York is busy with a movement, at this writing, to prevent the encroachment of factory buildings on the Fifth avenue shopping center. The better class of merchants are at last awake to the fact that unless something drastic is done to prevent it the retail shopping district will be driven out by loft and manufacturing structures that blot out whole gaps of area in its charm and continuity as a shopping promenade.

The result is a strong demand for the zone idea, the effect of which will be to make it illegal to set up manufacturing structures within a certain prescribed stretch of territory.

The zone or districting system will operate to prevent the shifting of trade centers that has been brought about in many of the big cities by the intrusion of structures alien and inimical to their established character. It should make for something resembling permanency in values.

PREDICT NEW RECORD IN BUILDING TRADE.

Despite the increasing cost of all building material and the increased cost of labor in the building trades, experts say the present year promises to establish a new record in building work in Philadelphia.

The year has opened with bright prospects for operative builders, who, it is expected, before it has closed, will far surpass last year's record of almost \$19,000,000 spent in dwellings alone. The bulk of house building, according to present indications, will be done along the Northeast Boulevard, where ground sufficient to provide sites for between 3,000

and 4,000 homes has been sold within the last four months. Many of these operations already are under way, and reports of selling received from builders are strongly suggestive of the boom conditions in West Philadelphia some years ago.

Much house building also will be done in West Philadelphia during the present year. The development will be of necessity confined to the territory close to the Cobbs Creek Boulevard. The building line has been pushed in the last few years so close to the Cobbs Creek Boulevard, or Sixty-third street, as it formerly was named, that little ground has been left undeveloped, and that little is mostly in isolated plots which continue to command steadily increasing prices. The indications are that before the year has closed there will be little ground left to build on close to Cobbs Creek Boulevard, from Market street to Woodland avenue.

With this territory developed there will be few large acreages left within the Forty-sixth Ward or in the Fortieth Ward, north of Woodland avenue, and any further development of the city westward must be on the west side of Cobbs Creek in Delaware County. This movement, indeed, may be said to have already begun with the recent purchase by John McClatchy of a tract of 50 acres in Delaware County, opposite the Sixty-ninth street terminal. Whether the proposal to annex Delaware County to Philadelphia County is carried to an issue immediately or not, there seems to be every probability that in a few years there will be enough Philadelphians residing in the county, if there are not enough there now, to give a handsome majority, if the proposal to join should be put to a vote, in favor of union with the city of Philadelphia.

DON'TS FOR SHEET METAL WORKERS.

Some "Don'ts" were printed on the call sent to members for the January meeting of the Sheet Metal Contractors' Association of Pittsburgh, Pa., which should be of interest to other trade organizations. These are as follows:

Don't miss the association meeting.

Don't be a silent member.

Don't be indifferent to your business and the association.

Don't accept a job at the other fellow's figure.

Don't become a delinquent in the association.

Don't work sixteen hours a day to make a living.

Don't guess when you figure plans. Be sure you are right.

Don't be afraid to play fair.

LUMBER YARDS

Third and Girard Avenue, Philadelphia

Protection for Lawns and Gardens
ANCHOR POST FENCES

are not the ordinary kind—they are fences of heavy galvanized netting erected on Anchor Posts—posts which won't sag or get out of line, and are galvanized both above and below ground to prevent rust.

In addition to fences and iron railings and gates of every kind we make tennis court, chicken-run and kennel-yard enclosures.

If you've got a specialty that will commend itself to builders, make a contract for space and start right in and talk about that specialty. Dwell on its good points, point out its advantages over similar devices, set forth its dominant qualities. And keep right on, week after week talking about it. If you don't book orders we'll bet you a big red pippin that there is either something better on the market or your specialty isn't worth a kopeck noway.

New Jersey Construction News

Residences (4), Annapolis avenue, Atlantic City, \$12,000. Architect, Seward G. Dobbins, 10 South Tennessee avenue, Atlantic City, N. J. Owner, Francis M. Cauley, Lincoln Building, Philadelphia. Residence, Trenton, N. J., \$8,000. Architects, W. W. Slack & Son, American Mechanics' Building, Trenton. Owner, Dr. Leland Kniffin, 726 Riverside avenue, Trenton, N. J. Brick, 2½ stories, 37x40 feet, slate roof, hot water heating, combination lighting, tile and hardwood floors. Owner ready for bids.

NEW JERSEY

Contracts Awarded

Store and Residence, Atlantic City, N. J., \$3,500. Architect, Seward G. Dobbins, 10 South Tennessee avenue, Atlantic City. Owner, Samuel Martini, Atlantic City, N. J. Brick, 2 stories, 17x60 feet, slag roof, hot water heating, electric lighting, tile work, limestone trimmings. Contract awarded to Lear & Pipher, Atlantic City, N. J.

Residence, 553 South Broad street, Trenton, N. J., \$5,900. Architects, W. W. Slack & Son, American Mechanics' Building, Trenton. Owner, Jacob Blaugrund, Trenton, N. J. Brick, 2½ stories, 19x52 feet, slate and tin roof, hot water heating, electric lighting. Contract awarded to David Teitz & Son, Trenton, N. J.

Factory, Lincoln avenue, Trenton, N. J., \$3,000. Architects, Kleeman & Fowler, First National Bank Building, Trenton, N. J. Owners, Nycoek Machine Co., 190 Jefferson street, Trenton, N. J. Brick and terra cotta, 1 story,

30x60 feet, slag roof, steam heating, electric lighting. Contract awarded to J. Joseph Dragan, 300 Berwyn avenue, Trenton, N. J.

FOREIGN STREET NAMES.

Even when its numbered streets are spelled out, as Two Hundred and Twenty-fifth, for instance, New York has no street names to match in length several with which the old world is afflicted. The Parisian record is Rue des Pretres-Saint-Germain-l'Auxerrois, while a thoroughfare in Brussels rejoices in the name of Rue de la Montagne aux Herbes-Potageres. In the outskirts of the Belgian capital one finds the Ougeschildezilverenoeckormootjestraat, which means simply the Street of the Little Unpicked Silver Nut.—New York "Sun."

Miscellaneous Construction News

Residence and Garage, Guyan Court, Del., \$25,000. Architect, J. J. Kennedy, Ford Building, Wilmington, Del. Owner, Mrs. Victor Du Pont, Wilmington, Del. Hollow tile and stucco, 3 stories. Residence, 35x82 feet; garage, 2 stories, 20x30 feet, slate roof, electric lighting, tile work, hardwood floors, damp-proofing (vapor vacuum heating reserved). Architect taking bids, due March 22nd. In addition to those previously reported, Pomerooy Const. Co., 1609 Ranstead street, Philadelphia, is figuring.

Residence (alt. and add.), Philadelphia Pike, Wilmington, Del. Architect, Edward Canby May, Dupont Building, Wilmington, Del. Owner, Frank D. Lackey, Ninth and Market sts., Wilmington. Stone, 3 stories; new wing, 65x40 feet, slate roof, steam heating, electric lighting, tile work, hardwood floors, metal lath. Contract awarded to W. D. Haddock & Co., 804 Orange street, Wilmington, Del.

Maryland Construction News

Bank, Emmittsburg, Md. Architect, John B. Harme, Wiest Building, York, Pa. Owners, Emmittsburg Saving Bank, Emmittsburg, Md. Brick, granite and steel, 1 story, 30x75 feet, slate and slag roof, steam heating, electric lighting, tile and hardwood floors, waterproofing and dampproofing, vault equipment. Owners will take sub-bids.

Store (alts.), 112-24 West Fayette street, Baltimore, Md. Architect, Clyde N. Friz, Munsey Building, Baltimore. Agent, William Martin & Co., 1 North Calvert street, Baltimore. Consists of general interior alterations, electric work, plastering and painting. Plans about completed. Architect will take bids in about one week.

Church, Mt. Washington, Md., \$30,000. Architects, Baldwin & Pennington, 330 North Charles street, Baltimore. Owners, Sacred Heart Catholic Church, Mt. Washington, Md. Stone, slate roof, steam heating, electric lighting. Plans completed. Architect will take bids in a few days.

Dairy, northwest corner Huntingdon ave (rear), Baltimore. Architect, Frederick E. Beall, 306 St. Paul street, Baltimore. Owner, Edward L. Kone, 625 West Thirty-third street, Baltimore. Brick and concrete, 1 story, 30x119 feet concrete floors, slag roof, electric lighting, dairy and refrigerating equipment. Plans completed. Owner ready for bids.

Factory, Eastern avenue and Thirty-first street, Canton, Md. Architect, Walter M. Gieske, Gunther Building, Baltimore. Owners, Baltimore Oil Engine Co., Alfred W. Gieske, president, 3-5 East German street. Brick and steel, 1 story, 150x100 feet, composition roof, plumbing. Plans about completed. Architect will take bids in a few days.

Hotel, northeast corner Light and German streets, Baltimore, \$750,000. Architect, Otto G. Simonson, Maryland Casualty Tower, Baltimore. Owners, Southern Hotel Co., Melville H. Carter, president, Calvery Building. Brick, granite and terra cotta, 14 stories, 93x148 feet, tile roof, steam heating electric lighting, terrazzo, marble and tile work, show-

er baths, vacuum cleaning system. Plans in progress.

Warehouse and Pier, Fourth street, Canton, Baltimore. Engineer, private plans. Owners, Canton Co., Water and Commerce streets, Can-

ton. Warehouse, 1story, 300x40 feet, slag roof, concrete floors, reinforced concrete; pier, timber piling and concrete, 75x500 feet. Plans in progress. Owners will take bids in about one month.

MARYLAND

Contracts Awarded

Office Building, Baltimore, Md., \$100,000. Architect, Louis Levi, Real Estate Trust Building, Philadelphia. Owners, Sun Life Insurance Co., 900 North Eutaw street, Baltimore. Granite base, brick, terra cotta and steel, fire-proof, 4 stories, 64x74 feet, steam heating, composition roof, electric lighting, elevator, marble and tile work. Contract awarded to H. D. Watts Co., Baltimore, Md.

Boiler House, Sparrows Point, Md. Engineer, private plans. Owners, Maryland Steel Co., on premises. Brick and concrete, 1 story, electric lighting. Contract awarded to P. J. Cushen, 217 St. Paul street, Baltimore.

Baltimore, Dock and Caroline streets, Baltimore, Architect, private plans. Owner, Wm. C. Robinson & Son Co., 32 South street, Baltimore. Brick, 1 story, 23x39 feet. Contract awarded to Consolidated En. Co., 32 South street, Baltimore.

Chapel (add.), St. Paul and Twenty-fourth streets, Baltimore. Architects, Ellicott & Em-mart, Union Trust Building, Baltimore. Owners, Goucher College, Wm. S. Guth, president, on premises. Stone, 3 stories, slate roof, steam heating, electric lighting, plumbing, tile work. Contract awarded to B. F. Bennett Building Co., 123 South Howard street, Baltimore.

Foundations, Loney's lane and Biddle street, Baltimore. Architects, Blanke & Zink, Equitable Building, Baltimore. Engineer, Wm. C. Schanble, Baltimore. Reinforced concrete, 30x36 feet and 70x16 feet. Contract awarded

to Singer Pentz Co., 600 Equitable Building, Baltimore.

Library, Twentieth and Wolfe streets, Baltimore, \$20,000. Architect, Otto G. Simonson, Maryland Casualty Building, Baltimore. Owners, Enoch Pratt Free Library, Bernard G. Steiner, librarian, Mulberry street, near Cathedral street. Brick, 1 story and basement, 57x83 feet, slate roof, tile work, ventilators, steel work (steam heating and electric work reserved). Contract awarded to R. B. Mason, 308 West Madison street, Baltimore.

Warehouse, 119-33 Denver street, Baltimore. Architects, Sparklin & Childs, Law Building, Baltimore. Owners, Wm. F. Zeller & Co., on premises. Brick and reinforced concrete, 2 stories, 70x115 feet, slag roof, reinforced concrete floors, steam heating, electric lighting, freight elevator, steel frames and sash, steel rolling doors, plumbing. Contract awarded to West Const. Co., Knickerbocker Building, Baltimore.

Y. W. C. A., 126-28 Franklin street, Baltimore. Architect, Joseph Evans Sperry, Calvert Building, Baltimore. Owners, Y. W. C. A., Miss I. F. Harmon, secretary, Baltimore. Brick, 6 stories, 69x141 feet, tile and slag roof, concrete dampproofing, steel and iron, skylights, fire doors, terrazzo, tile, marble work, heating, electric work and refrigerating equipment, kitchen equipment, 3 electric elevators. Contract awarded to George A. Fuller Co., Munsey Building, Washington, D. C.

Alan G. Smith (O), 6490 Woodbine avenue. Cost, \$4,000. Dwelling, Sixtieth and Coleman streets. Stone and brick, 2 stories, 22x49 feet.

Marshall & Gorman (O), 8 South Fifty-second street. Cost, \$164,000. Sixty-four stores and dwellings, brick, 2 stories, 15x42 feet, Fifty-eighth and Larchwood avenue.

Anne Rosenblatt (O), 422 Pine street. A. P. Lucker (C), 1727 North Fifty-first street. Cost, \$1,800. Dwelling, brick, 3 stories, 17x34 feet, 540 Lombard street.

A. Weise (O), Germantown avenue and Fox Chase road. H. A. L. Smink (C), 5320 North Twelfth street. Cost, \$4,700. Dwelling, brick, 2 stories, 36x32 feet, Krewstown and Fox Chase road.

H. Dolfinger (O), Sixteenth and Tasker streets. Wm. Dougherty (C), 1610 Sansom street. Cost, \$8,000. Stable, brick, 2 stories, 32x105 feet, 1516-18 South Bancroft street.

Walter V. Ashby (O), 2640 North Twentyninth street. Cost, \$29,000. Eleven dwellings, brick, 2 stories, 16x40 feet, Sixty-sixth avenue and Limekiln pike.

Joseph A. Blair (O), 4523 North Eighth street. Cost, \$37,800. Eighteen dwellings, brick, 2 stories, 15x42 feet, Fifteenth and Courtland streets.

Edwin Stall (O), 5430 Water street. Cost, \$21,600. Ten dwellings, brick, 2 stories, 14x38 feet, Tennie avenue and Tabor street.

Harry H. Heist (O), Sixty-fifth avenue and Limekiln avenue. Cost, \$42,500. Seventeen dwellings, brick, 2 stories, 16x40 feet, Sixty-sixth avenue and Limekiln avenue.

Alterations and Additions

Pietro Mazzalo (O), 606 Elymer street. Santi Cossa (C), 823 South Mildred street. Cost, \$800. Store and dwelling, 1142 Annin street.

Drew & Apsley (O), 1802 South Fifty-eighth street. Cost, \$800. Garage, Edgewood and Vine streets.

A. Egner (O), 2222 Brandywine street. M. Leahan (C), 638 North Twenty-third street. Cost, \$1,000. Store, 715-717 North Twenty-fourth street.

Alan G. Smith (O), 6490 Woodland avenue. Cost, \$4,000. Shop, Sixtieth and Colman streets.

Wm. McLean (O), Bulletin Building. Doyle & Co. (C), 1524 Sansom street. Cost, \$500. Office building, Juniper and Filbert streets.

Berg Bros. (O), Tenth and Market streets. O'Meara Const. Co. (C), 253 South Quince street. Cost, \$1,300. Department store, Tenth and Market streets.

Charles Sweeney Estate (O), 214 North Seventeenth street. John Howdens Son (C), 246 North Sixteenth street. Cost, \$364. Dwelling, 1605 Race street.

Morris Lang (O), 521 Bourse Building. Max Kane (C), 871 North Sixth street. Cost, \$700. Store and factory, 311 Market street.

David Brein (O), 715 South Fourth street. J. Copeland (C), 1645 North Eighth street. Cost, \$500. Store and dwelling, 713 South Fourth street.

Wm. Rosoff (O), 535 Bainbridge street. Fred Quate (C), 1323 Snyder avenue. Cost, \$3,200. Store and dwelling, 513 Bainbridge street.

James Kerr (O), 1739 North Mascher street. John Schuster (C), 3552 North Fifteenth street. Cost, \$1,000. Dye house, 1410 East Oxford street.

Mrs. Monales (O), 5720 Thomas avenue. M. W. Richey (C), 5008 Pentridge avenue. Cost, \$400. Store, 3724 Irving street.

R. Kenworthy (O), 5632 Ridge avenue. Brown Const. Co. (C), 4600 Main street. Cost, \$400. Dwelling, 5632 Ridge avenue.

Editorial Comment

One of the big steel concerns, engaged in the manufacture of steel sash, went to the trouble to secure opinions from 6,000 architects throughout the country on the question of winter building. More than half of all the architects approached expressed themselves as being in favor of building during the cold weather. One widely known architect, a New Yorker, stated:

"We make it a habit to build in the winter time because the last building we erected then was built at approximately ten per cent. reduction in the cost of materials and labor."

The company that made the canvass to ascertain how architects stood on the question is now launching an extensive campaign to persuade building owners to release contracts at once instead of waiting, as per custom, for the warm weather.

What is your own opinion as to the prudence of winter building?

* * *

The National Flower Show, which is to open in Philadelphia on March 25th, will be made notable by a series of lectures to be delivered by prominent architects, horticulturists and city planning experts from other cities.

A few of the afternoon speakers and their subjects are as follows: March 25, W. N. Rudd, of Chicago, "Home Grounds;" March 27, Prof. E. A. White, of Cornell University, "What Science Has Done for Floriculture;" March 28, Robert Pyle, of West Grove, "Roses;" March 29, J. Horace McFarland, of Harrisburg, president of the American Civic Association, "Civics for Home and Municipality;" March 30, J. tto Thiow, "Flowers from Snow to Snow;" March 31, Frank N. Meyer, of Washington, representing the Department of Agriculture, "Agricultural Exploration in China;" April 1, Arthur Cowee, of Berlin, N. Y., "Gladiolus."

The evening speakers so far secured are Richard Rothe, who will speak on "Rock Gardens" and show the motion pictures of last season's rose carnival at Portland, Ore.; Miss Caro Miller, on "Philadelphia School Gardens;" E. J. Wildey, of State College, on "Bulbs for Summer Bloom," and Max Schling, of New York, who will demonstrate "Cut Flowers in Proper Color Combinations."

* * *

The circular has just been issued for the "Walter Cope Memorial Prize Competition." It is given by Mrs. Walter Cope in memory of her husband, who was one of the founders of the T-Square Club. It consists of a first prize of \$100, a second of \$60 and a third of \$35, to be spent by the winners for books on architecture.

The competition is open to all those who, for one year previous to February 1, 1916, have been residents of Philadelphia or within a radius of 25 miles from City Hall. The drawings submitted shall be in accordance

with the requirements of the program, at the scales given, and no drawings other than those shall be submitted. The arrangement of the drawings on the sheets is left to the discretion of the designer, as also is the question of mounting. All drawings must be delivered at the T-Square Club not later than Monday, April 24, at 3 P. M.

* * *

Much thought is being spent at the present time by housing commissions, welfare workers and architects on the problem of providing houses for workingmen at moderate rentals, while at the same time obtaining an adequate income return to owners who may invest their money in such properties.

The object of the program proposed by the committee is to bring under the consideration of the competitors this problem in its general aspects. As it is essential, however, for the end in view, that the land selected as the site of the proposed houses be suitable both as to location and price, the committee has chosen a certain available lot, near the Midvale Steel Works. For the purposes of this competition the land may be considered as entirely flat.

Competitors may divide the lot by one or more streets. In distributing the houses, due consideration should be given to the orientation of the houses, as well as the new park to be opened by the city on the east side of Abbotsford street.

The lot in question comprises 2.7 acres of land, the whole lot being worth \$36,000. On this area the competitors may lay out as many houses as they choose, either individual, or in groups of contiguous units, keeping in mind, however, that as many open spaces as possible should be left, while fulfilling the condition of an adequate income return.

* * *

The gross annual rentals from the whole property should amount to not less than 10 per cent. of the total investment, including land and houses. Rentals shall be computed on the following monthly basis:

A. Two-story, two-family houses, with apartments to rent for \$9 and \$12, respectively.

B. Two-story, single family houses, to rent for \$13 and \$15, respectively.

C. Two-story houses, store on first floor and dwelling on second floor. Store, \$25; dwelling, \$12.

Of Class C there should be not more than eight in the whole area.

The cost of the houses shall be computed on the following basis:

Individual houses, or contiguous houses in small groups up to and including four, 14 cents a cubic foot.

Contiguous houses in groups of five or more, 12 cents a cubic foot.

Houses are to be cubed from cellar floor to

second floor ceiling, unless pitched roofs are used, in which case the cubage shall include one-third of the roof height.

As regards income, each house must be considered as a self-supporting unit.

The competitors should bend their energies to using inexpensive materials in a decorative way. No houses that are manifestly beyond the limit of cost allowed per cubic foot will be considered by the committee.

Due regard must be paid to the city building regulations.

Required for final drawings are the following: Block plan of the whole area at 1-16 inch to the foot; bird's eye view; first and second floor plans of house-types "A," "B" and "C" at 1/8 inch to the foot; front elevation of individual house or group unit of each type at 1/8 inch to the foot, and the drawings must be grouped on a sheet 30 inches by 40 inches by 52 by 62 inches.

For further information regarding the above write to John Molitor, chairman of committee, 130 South Fifteenth street.

* * *

Building operations throughout the country, as reflected by the summaries of permits issued in the principal cities, made an altogether satisfactory showing for the month of February. The comparative statement with January is also gratifying. According to official figures received by "The American Contractor," New York, the building permits granted during February in seventy-six of the largest cities of the country totaled \$53,219,098, as against \$44,280,506 for February last year, an increase of 20 per cent. In actual figures February exceeds January, the aggregate of which was \$51,697,497, although January's increase in percentage over January, 1915, was 35. The comparative gains are widely scattered and are not chargeable, as they are sometimes, to special activities in the larger cities. Of the seventy-six cities on the list, fifty-four show gains. In spite of the most active efforts being made in New York to radically readjust its construction policies, that city shows only a slight comparative loss as against February last year.

The combined showing for January and February is excellent, a total of \$103,086,065, as compared with \$81,512,340 for the first two months of 1915, an increase of 26 per cent.

* * *

The districting of the city for the purpose of segregating buildings according to use; the regulating of the height of buildings and the regulating of the area of courts and yards are the principal features of the tentative report submitted by the Commission on Building Districts and Restrictions in New York City.

"The temper in which the Commission has done its work is wholly commendable," according to the "Real Estate Record." "It was not biased by unsound social or economic theories. The objects which it has sought to achieve and the general principles by which it has been guided must be acceptable to all classes of the community.

"However, these general principles are few

and simple, while the conditions to which they have had to be applied are extremely complex. Sharp differences of opinion will no doubt arise over particular recommendations. But the spirit in which the Commission has done its work entitles it to expect co-operative and constructive, instead of destructive, criticism.

"Unfortunately, the Commission has not in its report supplied the data necessary to facilitate such criticism. It does not as a rule give the practical considerations which determined particular recommendations. There is, for example, no information upon which we can base an opinion as to how the tax levy of the city will be affected by the restrictions imposed upon the height of buildings.

"Nearly three-fourths of the total taxable land value of the city is concentrated in Manhattan. Is the taxable land value in this borough likely to be greatly decreased? In other words, will a very large proportion of the land in Manhattan not only depreciate in capital value, but also be required to pay a higher tax? Will the city's income be affected?

"There are other questions of importance raised by the Commission's recommendations concerning which its report offers no answer; and as matters now stand such questions will have to be given long and careful study without the benefit of a full knowledge of the Commission's line of reasoning. The absence of such reasoning is a disappointing feature of the report.

"Yet, in taking up the study of the Commission's recommendations, we propose to keep in mind this sentence, from its report: 'A city can, if necessary, accommodate itself to the crudities and imperfections of a physical plan, just as it can adapt itself to the rivers, hills and valleys that form its physical environment.' We have had enough of haphazard city development."

* * *

That's a novel and commendable idea which has been adopted at the architectural school of Columbia University—that of appointing architects of established reputation as a committee of visitors to check up scholastic results by professional standards. The following well-known architects have been named for Columbia by the organizations mentioned:

New York Chapter of the American Institute of Architects—Bertram G. Goodhue, Charles A. Platt and Edgerton Swartwout; Society of Beaux-Arts Architects—Thomas Hastings, Henry F. Hornbostel and Lloyd Warren; Alumni Association of the School of Architecture of Columbia—Goodhue Livingston, John Russell Pope and I. N. Phelps Stokes.

* * *

The New York "Sun" is not pleased with the daylight appearance of the ugly framework of the electrical signs that are a feature of that city's night life.

"New York's justly praised electrical display at night," says the "Sun," "is not gained without cost to the city's beauty at

other times. The stretch of city blocks that shines so brilliantly at night is a sorry skeleton in the day time with its gaunt iron structures shooting up meaninglessly from the rooftops."

ARCHITECTURAL NOTES.

Edwin Brumbaugh, son of Governor Martin G. Brumbaugh, of Pennsylvania, has opened an office for the practice of the profession of architecture, in the Real Estate Trust Building, Philadelphia, Pa. He is a graduate from the School of Architecture of the University of Pennsylvania and was the winner of the faculty medal and other prizes while a student at that institution. Since his graduation he has been connected with the offices of several prominent architects in Philadelphia and was lately chief draughtsman in the office of Charles Barton Keen.

* * *

Eugene H. Knight, architect, formerly connected with the office of William C. Weston, has opened offices for the independent practice of his profession in the Brown-Marx Building, Birmingham, Ala., and desires samples from manufacturers interested in the building trades. He was formerly connected with Henry Hornbostel, of New York City.

* * *

Howard F. Daily, architect, has opened offices for the practice of his profession at 7 East Main street, Amsterdam, N. Y., and desires samples and catalogs from manufacturers interested in the building trades.

* * *

Martin C. Parker, architect, has opened an office for the general practice of his profession in the Alexander Building, Beaumont, Texas, and desires samples from jobbers and manufacturers.

* * *

J. P. Wells, consulting hydraulic and sanitary engineer, has moved his offices from the Exchange Place Building to the Cutler Building, Rochester, N. Y.

* * *

Charles F. Schweinfurth, architect, has moved his offices from the New England Building to Garfield Building, Cleveland, Ohio.

Without energetic effort a man must remain in a rut and can never expect to share with his hustling, up-to-date competitor. Quoting the words of a gifted scribe: "Health attends the man who acts. Wisdom guides him. Hope frees him. Joy helps him. Power moves him. Progress marks him. Fame follows him. Wealth rewards him. Love chooses him. Fate obeys him. God blesses him. Immortality crowns him."

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

WATERPROOFING BACKS OF WOOD FINISH IN CONCRETE BUILDINGS.

In connection with the wood finish of some concrete buildings on the Pacific Coast trouble was experienced by a California builder with the moisture coming out of the cement and warping the woodwork, and request was made of "The Painters' Magazine" for a formula for a paint that would waterproof the back of the wood finish.

The following reply was furnished by the magazine in question:

"The very best and probably the only means to keep the wood from being affected by the moisture coming from the source mentioned is to dissolve one part by weight of paraffin wax in two parts by weight of heavy coal tar oil, also known as heavy naphtha, which is readily obtainable in your State. As paraffin wax has a melting point between 118 degrees and 130 degrees F., the solution can be made by steam heat without fire risk. It should be used fairly warm and several applications made.

"However, even by the use of this moisture-shedding preparation, you cannot guarantee to keep the wood from warping, when the walls are not entirely dry or when moisture percolates through from the exterior of the walls. Even if the walls were waterproofed on the inside by painting, the moisture coming through from the outside is apt to throw off the paint back of your wood finish."

Lots of men don't advertise because they cherish an idea it's too expensive. As a matter of fact, it's the cheapest good investment a man can put his money in, as hundreds of successful men have learned.

EXPERT TALKS TO T-SQUARE MEN

John Lofting, Jr., of London, Eng., Tells Value of Quantity Surveying.

At the regular meeting of the T-Square Club, held at the club house, on South Quince street, Philadelphia, last Wednesday evening, John Lofting, Jr., member of the Quantity Survey Association of London, Eng., addressed the meeting on "Quantity Surveying," about which he said it was the only method that would be devised by a committee of architects and builders who sought to cut out waste effort in building operations and to assure fair and profitable dealings between owner, architect and builder. That it does accomplish these things, he said, is proved by its continued use in England for nearly 75 years.

The fundamental principles of quantity surveying is that the quantities of work involved in a building operation shall be accurately determined by a single responsible party and shall be furnished for use in determining the contract price for the original design, and later that the quantities involved

in changes shall be furnished for the valuation of all changes. In other words, the quantity surveyor supplies accurate quantities for every purpose from the start to the finish of a job.

Mr. Lofting pointed out the advantages of quantity surveying in getting preliminary estimates, which, he said, not only relieved the architects of any obligation to the builders, but it also avoided draughting room expense and delays caused by reasons made necessary by bids overrunning the appropriation. In a word, the preliminary service has a real money value to the architect and to client, and obviates contractors giving their time without pay.

The main service of the quantity surveyor comes when the final design is made and the specifications prepared. He then takes off accurate detail quantities in each trade separately and supplies them in itemized lists called bills of quantities, ready for pricing. These are given to the contractors competing for the job, to be used in making up the bid, which necessarily causes a great saving of labor to the contractor and assures accuracy for all.

Mr. Lofting presented many other strong points in its favor and made his talk most interesting and instructive.

EXPENSIVE ERRORS IN BUILDING PLANNING.

When a structure is designed and erected for a specific purpose, it is oft times difficult to alter it so that other lines of business can occupy the premises to advantage. Or course, there have been many instances where this has been done to advantage, notably old-time stables and churches have been converted into garages and moving picture theaters.

Knowing that there is a constant shift of population, that business centers are continually moving, a property owner will do well to look far ahead in the planning of his building and see if there is not a possibility of so planning his structure that, should the occasion arise, alterations could be made, at the minimum expense, so that he may be able to keep abreast of the times.

Usually there are several forces acting to induce the owner to build to the greatest possible extent. The real estate agent desires to make the property attractive, so he figures a big rent roll from a large area of floor spaces; the architect has somewhat similar ideas of propriety and is anxious to obtain the best possible return to his client, so he plans every possible square foot of floor space, front, rear and interior; light, shaded and

dark, and the builder clinches the argument in the general interest of building as much as possible, on the ground that it is cheaper to build by the cubic yard than by the cubic foot.

Thus the site becomes covered with as much building as possible; a fundamental error. Space, irrespective of light, air and access, is of no value at all, but acres of expensive floors have been and are being added on the basis that it is. The stolen light is, of course, responsible for much of this mistaken attitude. When a box of a building can be run up on a site occupying 85 per cent. of the area, it looks like a lot of valuable property on each floor. Much of its interior is, however, dependent for light on side windows overlooking abutting property. Usually this is built upon later, and then the space inside the building is darkened and its value lessened.

As in the other lines of decision the less the commitment the less the effect of a mistake. Property owners think or are led to think that by excessive building to-day they can capitalize the increase of value of a site in the future. That view is reflected in the design of some modern skyscrapers, and many continue unless people learn the fact that such a process does not work.

In a crowded city, excess building can go in one direction only which involves an additional rate of expense in cost of every part of a building and a permanent addition to the operating charges.

There are fundamental facts which every owner should assimilate, and, if he wants proof of it let him, when contemplating a new building, prepare three plans—one for a one, two or three-story building, one for a twelve story building and one for a skyscraper, all of equal character and plain—and take prices.

He will find the cost per cubic foot on per square foot of area that can be occupied will increase in proportion to height from the street and the proportionate depth below which are involved.

If he looks into the details of operating cost he will find that the major portion of a tall building is not earning money to pay for its own cost and that the real support comes from the street level or a few floors above.

Without the upper stories he would have no elevator travel, no pumps for water and lessened costs of upkeep, operation and maintenance throughout.

In the excessive building he will perhaps have been led into spending tens of thousands of dollars upon expensive power machinery, entering into business of a totally different character to real estate, in order to give away electricity to his tenants as an inducement, really contributing a reduction in their rents, besides giving them steam to waste as they please, shades and awnings, window cleaning and office cleaning, sanitation, hot and cold water, elevator service, cooling fans, iced water, janitor service, police, rest rooms, roof garden, nearly every convenience conceivable, except providing free cigars and matches. Even a club may have to be pro-

vided to make the building attractive, and may have to be supported if it does not prove a success.

Then, after the owner feels that everything is serene, along comes the tax commissioner and whoops up the land assessment on the same basis of anticipation of future increment of value, and the city taxes eat up the increment at the rate of one-thirtieth part yearly.

We have beaten the world in skyscraper construction, and have had the best opportunity to learn all about them, and by now it seems time to call a halt.

These considerations apply markedly to over-building in the vertical direction, but in a measure apply also to all classes of structures.

If an office sixteen feet deep will rent for as much as another twenty feet deep, there is no value in the four feet of extra building space.

If a loft can be lighted naturally by raising the ceiling, and will rent better as a result, the extra space may be well worth constructing.

But if the same result can be brought about by keeping the same ceiling height and reducing the dark interior space, then the extra investment will be saved and better returns secured.

Therefore, the fundamental principle in the problem of the building is:

The least possible amount of building for the highest rates of revenue.—New York "Record and Guide."

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

**The circular of information for the 22nd Architectural Exhibition of the Philadelphia Chapter, A. I. A., and the T-Square Club was issued last week. The exhibition will be held in the galleries of the Art Club, May 7-28. The circular states that the exhibits must consist of drawings, models and enlarged photographs of executed or proposed work, illustrative of structural, decorative and landscape architecture; sketches and paintings of decorative subjects, and executed work in the applied arts. It also mentions the conditions, presentation, charges and liabilities. For further information, address E. Perot Bissell, chairman, 806 Bailey Building, Philadelphia.

**The activity at the Philadelphia Master Builders' Exchange shows no abatement. The weekly luncheons, held Tuesdays, are proving popular. At last week's gathering much enthusiasm was shown, and the speaker, Arthur E. Hutchinson, was well received. He talked of "The Housing Conditions of Philadelphia." The real big affair of the Exchange took place on the night of March 16, and was known as "Get Acquainted Night." The purpose of the affair was to give the new and

old members an opportunity of becoming just a little more friendly. Formal introductions were not necessary. Each man carried a "name tag."

**The National Association of Master Gravel and Slag Roofers, at its recent annual meeting held at Jacksonville, Fla., elected the following officers for the ensuing year: Albert Baldwin, Chicago, Ill., president; Everett Jameson, Buffalo, N. Y., and Henry Smither, Indianapolis, Ind., vice-presidents; H. B. Nichols, Chicago, Ill., secretary and treasurer; J. H. Holder, New Cork, assistant secretary. Members of the executive committee include J. C. Norton, Cleveland, O.; William R. Ponnig, Brooklyn, N. F., and Ralph Ysao, Chicago, Ill.

**The Paragon Plaster Company, Syracuse, N. Y., at its recent annual meeting re-elected Jacob Amos, president, and A. E. Nettleton, vice-president. Emil Hanson was elected secretary and W. K. Squire, treasurer and general manager.

**The New York State Retail Hardware Association at its recent annual meeting at

Buffalo, N. Y., elected the following officers for the ensuing year: J. B. Sellers, White Plains, N. Y., president; Irving Van Voris, Cobleskill, N. Y., first vice-president; W. N. Briggs, second vice-president; Frank E. Pelton, Herkimer, treasurer, and John B. Foley, Syracuse, N. Y., secretary.

**The Kanawha Manufacturing Company, Charleston, W. Va., has recently opened a New York office at 101 Park avenue, in charge of J. F. Siegel, who was formerly the New York manager for the Pressed Metal Radiator Company, of Pittsburgh, Pa.

**The American Society of Engineering Contractors at its recent annual meeting elected the following officers to serve for the coming year: William P. Carmichael, St. Louis, Mo., president; John J. English, Manhattan, first vice-president; J. R. Wenlinger, Manhattan, secretary, and G. A. Unverzagt, Manhattan, treasurer. F. E. Cudworth, Charles H. Hoyt and Renwick B. Knox were elected directors.

**C. Peterson, formerly connected with the main office of the Trussed Concrete Steel Company, has been appointed sales engineer in the company's branch office in the Munsey Building, Baltimore, Md.

**G. W. Roosa, formerly connected with the lighting department of the Westinghouse Electric and Manufacturing Company, recently became associated with the Holophone Glass Company, and will have charge of the sales of Holophone glassware in New York City, Ohio and Western Pennsylvania.

**Prof. Clarence Ward, of Rutgers College, and lecturer in architecture in Princeton University, gave an illustrated lecture on "The Rheims Cathedral and Its Place in Mediaeval Art," at a meeting of the New York Society of the Archaeological Institute of America, in Class Room A, Metropolitan Museum of Art, Monday afternoon, March 6.

HARRISON, MERTZ & EMLEN.

A corporation has been formed under the laws of Pennsylvania to be known as Harrison, Mertz & Emlen, for the purpose of continuing the hydraulic and sanitary engineering and construction business of the former firm of Harrison & Schreiber, 725-26 Commercial Trust Building, Philadelphia. The new corporation will specialize in the design and installation of private utilities for country residences, farms, institutions, schools, hospitals, country clubs, etc., including water supply, irrigation disposal of sewage, lighting and refrigeration. Among recent installations made by this firm are the residences of John W. Converse, Rosemont; Dr. H. C. Diamond, Rydal; Francis R. Strawbridge, near Downingtown; J. Henry Seattergood, Villa Nova, and A. J. Drexel Paul, Radnor; the Williamson Trade School, at Wawa; the Lucas Paint Works, at Gibbsboro, N. J.; the Phoenixville Hospital, the Megargee Paper Mills, at Coatesville; the Burn Brae Hospital, at Clifton Heights, and Hood College, at Frederick, Md.

TRADE **ECONO** MARK
EXPANDED METAL

"ECONO" expanded metal is furnished in meshes like the one illustrated above for reinforcing concrete floors and roofs, sewers, bridges, bridge floors, culverts, conduits, tanks, etc.

The meshes for this purpose are 3 and 2¼ inches wide. We are also in position to furnish a special mesh 5¼ inches by 12 inches for use in reinforcing concrete roads and pavements.

"ECONO" expanded metal is furnished in ½, ¾ and 1½ inch meshes for use as machine guards, screens, etc.

The 1½ inch mesh is frequently used for partitioning off a portion of floor space for use as stock or tool rooms. It makes a solid partition but at the same time does not obstruct the passage of light and air.

MILLS

"Recommendation"

A boiler recommended by all who use them is not necessarily a reason why you should buy that boiler. But it is perhaps a reason why you should see that boiler before installing any other.

The H. B. SMITH CO.

1225 Arch Street

PHILADELPHIA - PA.

Protection for Lawns and Gardens

ANCHOR POST FENCES

are not the ordinary kind—they are fences of heavy galvanized netting erected on Anchor Posts—posts which won't sag or get out of line, and are galvanized both above and below ground to prevent rust.

In addition to fences and iron railings and gates of every kind we make tennis court, chicken-run and kennel-yard enclosures.

Editorial Comment

The "Craftsman Magazine" is running a series of articles on "The Home of the Future" that bid fair to take rank as notable contributions to the literature of architecture. The article in the March number, by Mr. H. T. Lindeberg, is so rich in quotable things about our American domestic architecture that we should like to reproduce it here in full for the benefit of our readers if the necessary space could be spared. Inasmuch as this not possible, we shall try to content ourselves with touching here and there upon the many attractive things Mr. Lindeberg finds to say about country house planning and design.

"The first beautiful flower of architecture in America was the Colonial, with its many variations, from the old plantation house of Greek inspiration to the Dutch Colonial in Pennsylvania and the Adam-Colonial in New England," writes Mr. Lindeberg. "It was an architecture suited to those days, born of the interest as well as the memory of the people, and furniture came from the hands of native craftsmen that fitted it and silver to adorn the table and fabrics and tapestries for the walls. This artistic state lasted just so long as the people were held in check; but once the freedom of the land was ours, with all its fairy wealth and undiscovered beauty, we were up and away again. And all along the trail from New Amsterdam to the Pacific Coast we camped—we lived in wagons, in dug-outs, we contented ourselves for a month or two in log cabins, we developed new characteristics with this roving free life, we became a new race, a new nation."

Architecture as a fine art ceased to exist during this period. The man whose concern is to throw up quickly a place of shelter in the wilderness does not stop to think of the artistic.

* * *

But as we grew rich through our successful ventures, we suddenly became ingenuously and hopelessly elaborate in our tastes. Then we reacted in an extraordinary degree to the modern French influence.

"Nothing," writes Mr. Lindeberg, "could have been more disastrous to the development of American architecture. This does not mean that I have any criticism to make of the Beaux Arts school—for France; but for America I want an architecture, both public and domestic, that is suitable to the people and expresses them.

"There was a long period of time when the foreign stamp was the hall mark of beauty for Americans. The foreigners who visited us did not think much of our country, it was large and empty and alien to them, our homes were without comfort or charm to them; we lacked tradition and sentiment. An strangely enough, we permitted foreigners to establish for us an impertinent point of view toward our own land, and we grew to believe not only

that we did not possess art, but that we could never create it. We were told so by foreign artists, and we told each other so, and hastened away to Europe to bring back beauty. And we found it, and brought it back, and tried our utmost to acclimatize it to our American spirit, but it was hopeless. We built imitation Trianon paplases, we had little Versailles gardens and we came up from the heart of New England and out from the great plains of the West to live in them and we never had a moment's comfort or real enjoyment beyond the satisfaction of our pride."

* * *

"Within the last decade or so there has been a widespread revival of interest in home making in America, an immense upspringing of individual delight in home construction. Our architects are practically turning their back on Europe, not on her history and tradition and inspiration, but on the desire to reproduce individual models of European architecture in America. They are studying our own landscape, North, East, South and West; they are building to suit it, and they are building houses out of the materials that are intimate to the landscape. Although the wooden house is no longer built in the city or in any community where houses are very closely established, wood is nevertheless a much valued and very beautiful material for houses in large open spaces, in the mountains, at the seashore, on the country lane. And I feel confident that the time will come when this material will be so handled by that mysterious agency known as fireproofing that we shall even see beautiful wooden houses again in our towns and villages.

"Of course," says Mr. Lindeberg, "very few people who are building beautiful homes have the time to take up a thorough study of architecture, and although they have in mind the kind of house they want, the men who are putting much money into buildings to-day naturally turn to architects for advice. This is perfectly reasonable, is of advantage to the builder and a great advantage to the growth of a beautiful architecture because if all people were left to devise their own houses without very much time to think or plan, we should have a return to that terrible period of architecture in America which has facetiously been dubbed 'the early Garfield style,' and was the expression of the American mind freeing itself from early native tradition and from foreign influence."

* * *

These "early Garfield" structures, poorly built, have largely passed away. "But they have lasted long enough to prove the value of some standardization of architecture in our country, the need of a certain guidance from people who are giving their life to the art

for the man who is thinking for the first time of building a house.

"Just as a symphony orchestra of really intelligent and gifted musicians requires a conductor to accomplish the final production of a great piece of music, so I think in building the architect who has trained himself to study art, men and landscapes, can be a very valuable factor in giving comfort and beauty to the home lover in producing permanent architectural beauty for the country."

After speaking of the importance of simplicity as a means to the finest in country house design, Mr. Lindeberg writes:

"Formerly we felt that the minute we wanted space in our homes, we must have miniature palaces or houses that looked like a Roman capitol or suggested little Parthenons. I no longer believe that a different kind of architecture is necessary for a large building. **Whatever is good for the small house, whatever is wise in its construction, in its proportion, in its roof lines, in its grouping of windows, in its balance, is good on an enlarged scale. We do not have to change the style of architecture to suit space.** This was one of the fatal errors of our first American houses. Now, as a matter of fact, I believe that many a peasant cottage in France or Germany or England could, in the inherent excellence of its construction, in the wisdom of its proportion, in the beauty of its line, be enlarged into a satisfactory and artistic structure for the larger house to-day.

* * *

"I have one client who has brought this forcibly before me recently. When I asked him just the kind of house he wanted, he said, 'I want it large, comfortable, sanitary, beautiful, and then I want the outside to look humble.' I consider this the perfect description of ideal American domestic architecture. By humble he did not mean poor or tawdry or inharmonious; he meant that he wanted the home quality everywhere. He did not want the effect of St. James' Palace and the Madeleine and the cloisters at Bologna all combined in marble from Italy to overwhelm and shadow his neighbors.

"In every house I build I find it more and more interesting—this study of simplicity. I no longer find it necessary to have large window frames, I have a simple gutter instead of molded eaves, I make my roof a waving line of beauty in many colors, my windows are not always strictly balanced, I do not demand absolute similarity in the two sides of my house, the porch is an opportunity for sunlight and air. I am not striving ever for impressiveness, but always to eliminate, to do away with every idle bit of wood or concrete or piece of brick and constantly, as I am developing the outside to that of the inside, of the home side.

* * *

"The great difficulty with old colonial architecture, the trouble I find when I am asked to revive it for a client," remarks Mr. Lindeberg, "is the fact that its formality, its balance, the various external attributes that give it is classic beauty, of necessity impinge upon

the interior of the house. One room after another in those lovely old houses resembled each other as closely as one home did another. The rooms were arranged to conform to the windows and the gables and the entrance. No variation could be made without changing the exterior, and that would have been an architectural crime. **To-day I feel that the real builders of homes are thinking first of the charm and the beauty of the interior, of the fireplaces and the windows that will admit sunlight, of the opening of one room into another, making the hall light, of convenient bath rooms well ventilated, of nurseries in which little folks flourish.** In other words, we are putting into our architecture (every man who is building well, and they are an ever increasing number), the free, wholesome, enlightened spirit that should belong to a free, wholesome, enlightened democracy. Indeed, all architecture that matters must rise or fall by the spirit that fashions it. Whitman believed this; he saw into the truth of the relation of homes to the people when he said: 'You thought not to destroy those valuable houses standing fast, full of comfort, built with money. May they stand fast then? Not an hour, unless you above them and all stand fast.'

* * *

"In the past we have been a little afraid of having our architecture too plain, just as we have been afraid of having our lives too simple. We have not realized that increased decoration did not always make for more beauty, that the purpose of art was to express something very fundamental and splendid in nature, not to adorn human beings. So in making our houses, if we use all our materials with the set purpose of building excellent homes without regard to former architectural expressions without fear, we may in time achieve without reproach. Much of this spirit is to-day being put into the English country architecture; indeed, much of it has always been in the English home. I believe this is because, from the very beginning, the English people, perhaps from their insular position in relation to other nations, have accepted their homes as an immensely important institution; they have been rovers, ever of sea-faring disposition, but never for long; they have not been good settlers of many countries, except as colonists; the homing instinct has always brought them back to their own nation, and this instinct has built for them the most beautiful, capacious, comfortable home structures in the world. You feel in every well built English home a direct purpose. It is built to give happiness, to become the place in which people shall be contented, a place for birth and death, for all life; not merely amusement, but for wholesome human existence. A study of the spirit of English domestic architecture, old and new, would be of value to our own architects, not to create any spirit of imitation, but to bring about a realization of the purpose, the fine expression, and the true achievement of the English architects."

On the subject of the prevailing drabness

of American country houses, Mr. Lindeberg observes:

"I think in building our houses here in America we have been a little ashamed or afraid to make them look joyous. We have softened all our colors on our houses and in our gardens. But more and more we are getting away from this; we are no longer afraid to have playful effects in the use of color. We like the French blue blinds and the black lintels and the variegated roofs, our gardens are filled with brighter flowers, and here and there an architect is with beautiful effect introducing the colored tiles into the ornamentation of concrete houses. Mr. Goodhue has done this with rare beauty in his San Diego dwellings. You see it occasionally in New York even in business buildings, and more and more often in houses near the seashore where the concrete weathers into misty grayness, and the architecture needs the relief of permanent brilliant tone. Beautiful tiles are made to-day in rich blues and greens, and the effect of these when wisely introduced as decoration gives very much the same joy as a vivid flower garden or a stained glass window."

* * *

Do you wonder that we write with some enthusiasm of Mr. Lindeberg's article? Here is an architect who has ideas—one of the little group of really notable men whose work is giving us an American architecture, an architecture informed by true artistic feeling and one based upon the world-old principles of sentiment, harmony and balanced proportion.

STUDY THE ADVERTISING PAGES.

The average reader does not pay very close attention to the advertising pages unless he happens to be particularly interested in some product or is in the market for equipment or material. He is missing a part of scientific literature which offers suggestions as practical as the reading pages. He is also losing an opportunity of studying a subject which bears the most important relationship to every business on earth. No matter what line of work you may be engaged in, a knowledge of publicity and salesmanship is valuable. Every form of occupation to be made successful depends upon a degree of salesmanship. Study the advertising pages. They represent an expenditure of time, thought and money, which makes them well worthy of your attention.—"Municipal Engineering."

We know lots of men who have made money without the aid of advertising, but—they haven't made it since 1876.

Graham-Campion Co.

DEPENDABLE

BUILDING CONSTRUCTION

1215 Filbert Street

Philadelphia

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

SOUTHERN PINE ASSOCIATION DEPARTMENT HEADS AT INFORMAL MEETING

Secretary-Manager Rhodes, of the Southern Pine Association, tendered the heads of the departments and field force a dinner in appreciation of their loyalty and devotion to the association.

There were sixteen plates, and the dinner was served at Galatoire's, one of New Orleans' famous French restaurants. It was an informal gathering, productive of much good, and it has served to bring the secretary-manager into closer contact with the employees of the association who are handling under his supervision the enormous amount of detail work.

Mr. Rhodes made a statement on the work that the association has already done and the plans for 1916, and the evening was spent discussing the best means of accomplishing the results desired. Many useful suggestions were made, and the meeting proved such a success that Mr. Rhodes announces that in the future he will bring the heads of the departments together about once a month in similar conferences.

Those present were: J. E. Rhodes, secretary-manager; Wallace J. J. Ferry, advertising manager (Kansas City); Edward E. Myers, assistant secretary; A. G. T. Moore, traffic manager; F. P. Hamilton, paving engineer; J. E. Jones, chief inspector; T. E. Flanders, instructor of grades; J. C. Valadie, engineer; F. V. Dunham, field agent; E. W. Brown, auditor; F. Marfese, inspection department; W. M. Murphy, superintendent mailing room; E. E. Pendleton, exhibit expert; H. C. Berckes, file clerk; C. W. Vuncannon, inspection department; Arnold Von Schrenk (St. Louis), representing Dr. Hermann Von Schrenk.

Permits for New Buildings

O is the abbreviation for owner. C is for contractor.

Philadelphia

Joseph A. Blair (O), 4523 North Eighth street. Cost, \$5,200. Two dwellings, brick, 2 stories, 15x42 feet, Seventh and Courtland streets.

Caledonian Dye Co. (O), Emerald and Westmoreland streets. Stewart Bros. (C), 2428 Orkney street. Cost, \$11,000. Factory, brick, 2 stories, 72x80 feet, Emerald and Westmoreland streets.

Cost, \$1,700. Store and dwelling, 4344-46 Germantown avenue. streets.

PLACE AND VALUE OF THE TRADE PAPER.

"Eloquent speakers who have preceded me have told of the greatness of our American industries, and have rightly given to advertising a large measure of credit for our industrial and commercial supremacy.

They have spoken of the daily and weekly newspapers, the agricultural press, the magazines, the billboards, the street cars, and even the advertising novelties, as the forces that have played an important part in this wonderful upbuilding, but they have wholly missed the greatest force of them all—the trade and technical press of the country."—R. R. Shuman before the annual convention of the Associated Advertising Clubs at Omaha.

If you can persuade people to buy your goods you make money. "The Guide rounds up in its clientele the people you want to persuade. A certain amount of space and the right kind of selling argument does the rest.

Statement of the Ownership, Management, Circulation, etc.

Statement of the Ownership, management, circulation, etc., required by the Act of Congress of August 24, 1912, of The Philadelphia Real Estate and Builders' Guide, published weekly at Philadelphia, for April 1, 1916:

State of Pennsylvania,
County of Philadelphia.

ss.
Before me, a Notary Public in and for the State and county aforesaid, personally appeared Louis S. DeLone, who, having been duly sworn according to law, deposes and says that he is the Secretary of the Building News Publishing Company, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publishers, Building News Publishing Co., Perry Building, Philadelphia, Pa.

Editor, John Irving Dillon, 5716 Christian street, Philadelphia.

Managing Editor, none.

Business Manager, none.

2. That the owners are:
Building News Publishing Company.

William S. Harvey, 2nd, Bala, Pa.; Louis S. DeLone, 6419 Drexel Road, Philadelphia, Pa.; Samuel R. McDowell, Narberth, Pa.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent. or more of total amount of bonds, mortgages, or other securities are none.

(Signed)

Building News Publishing Co.,

Louis S. DeLone, Secretary.

Sworn and subscribed before me this 22nd day of March, 1916.

Edward J. Toole, Notary Public.

(My commission expires January 21, 1917.)

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

****E. B. BADGER & SONS CO.**, manufacturers of copper boilers, expansion joints, pantry sinks, and general copper work, has opened a New York office at 101 Park avenue, in charge of D. J. Dever.

****JOHN Z. DOLPH CO.**, manufacturers of insulating paints and compounds, has moved from 317 New Jersey Railroad avenue to 168 Emmett street, Newark, N. J., where the capacity of the plant has been more than doubled.

****A. N. JOHNSON**, recently connected with the Bureau of Municipal Research of New York City, has accepted the position of consulting highway engineer for the Association of American Portland Cement Manufacturers.

****C. J. CURTIN**, of the Farnham-Cheshire Lime Company, and Elliot Smith, of Candee, Smith & Howland Co., have been nominated for president and vice-president, respectively, of the Building Material Exchange. The election will be held in April.

****H. L. LEWMAN**, for the last two years president of the National Association of Builders' Exchanges, was recently elected an honorary life member of the organization in recognition of his untiring effort in behalf of the association during his administration.

****NEW ENGLAND ENGINEERING CO.** has discontinued its branch office at 30 Church street, New York City, and will in future conduct the business from its main office at Waterbury, Conn.

****E. M. HAGER**, formerly of the Universal Portland Cement Co., has accepted the presidency of the Wright Company, of 5 Nassau

street, New York, manufacturing aeroplanes.

****R. A. KIEFER** has recently been placed in charge of the New York office of the Gardner Governor Co., of Quincy, Ill. The office is located in the Singer Building, 149 Broadway.

****NATIONAL FIREPROOFING CO.**, last year, according to President W. D. Henry, passed through a period of marked depression, aggravated by the Chicago building strike. Business of the company is now improving, he adds, 1,390 cars of products being shipped in January last, compared with 990 cars in January, 1915. Operations for 1915 resulted in a deficit of \$98,907, compared with \$55,895 in 1914. No dividends were paid last year.

****JAMES B. OLSEN** has been appointed general sales manager of the Habirshaw Electric Cable Co., recently formed by the consolidation of the Habirshaw Wire Co., the Electric Cable Co. and the Waterbury Co. For the last eighteen years he had been sales manager for the Habirshaw Wire Co., and prior to that had been connected with the sales department of the New York Insulated Wire Co.

****NATIONAL ELECTRIC UTILITIES CO.**, manufacturers of Neuco heating appliances, has removed its New York offices and display rooms to 103 Park avenue. The factory in New York City has been discontinued, and a new factory opened in Danbury, Conn. The company manufactures household ranges, together with hotel and restaurant electrical equipment, and electrical heating and drying appliances for mills and factories.

AMERICAN COAL PRODUCTS COMPANY CHANGES NAME TO THE BARRETT COMPANY.

It is announced that the American Coal Products Company and the Barrett Manufacturing Company have decided to unite the good-will and high reputation of both concerns under the name of The Barrett Company.

The American Coal Products Company is well known in connection with the sale of Sulphate of Ammonia, and heretofore owned the stock of the Barrett Manufacturing Company.

The fact that all the coal tar chemicals, disinfectants, roofing, waterproofing, road-making and wood preserving materials have been made and widely advertised in the name of the Barrett Manufacturing Company has added immensely to the good-will attached to the Barrett name. This increase, however,

has not been connected in the minds of the general public with the securities of the American Coal Products Company.

The new company will have the same amount of stock as the American Coal Products Company and the change in name will be accomplished by exchanging the outstanding certificates share for share.

Some of the widely advertised trade-marks of the Barrett Manufacturing Company will be recognized in Barrett Specification Roofing, Taraia, for roads, and Congoleum floor coverings—the latter being manufactured and distributed by The Congoleum Company department of the Barrett Company.

The products of the Chemical Department of the Barrett Company are receiving particular attention at this time, due to the European situation, and it is expected that this branch of the business will be of larger importance hereafter, as the advantage of an American

source of supply will doubtless appeal to users of these products in this country.

The Barrett Company in this department has produced for many years pure (natural) Carbolie Acid, Cresylic Acid, Refined Naphthaline (in various forms), Benzol, Toluol, etc., in addition to which they also now manufacture considerable quantities of Synthetic Carbolie Acid (Phenol).

MAKES SALES HEADQUARTERS AT PHILADELPHIA.

The Cherry River Boom and Lumber Company, manufacturers and wholesalers of spruce, hardwoods and cypress, have established sales headquarters in Philadelphia, with offices in the Pennsylvania Building, Fifteenth and Chestnut streets, to which address all correspondence should be sent. Heretofore the selling department has been quartered with the executive offices at Scranton. The company also controls the output of the Hebard Cypress Company, which now centers its selling activity at Philadelphia, which location provides for a somewhat quicker handling of inquiries from the trade. The company also maintains branch offices at 52 Vanderbilt avenue, New York.

* * *

WACCAMAW BRAND GUM FLOORING.

Messrs. Currie & Campbell, wholesalers of spruce, hemlock and hardwoods at Philadelphia, are making a special drive with their Waccamaw brand of gum flooring. This brand of flooring has just been used exclusively in several new buildings in and near Philadelphia, including that of the Lincoln Furniture Company, the Claremont Apartments and the Linker Building, in Philadelphia, and the Keystone Leather Company, at Camden.

* * *

TO SPECIALIZE IN SOUTHERN HARDWOODS.

Joseph A. Murray, who was formerly employed by Lewis Thompson & Co., has organized the firm of Joseph A. Murray & Co., and has taken offices in the Widener Building, Philadelphia. The new firm will specialize in the handling of Southern hardwoods.

There's one variety of advertiser who gets our Angora. This is the chap who can't afford a large space and doesn't advertise, as a regular thing, because a small space "isn't seen." Some of the biggest advertisers we have started out with small space. Ask them whether the small space is seen. If advertisers had to wait until their businesses developed to full page stature before advertising, there'd be mighty few advertisers. The big man becomes big by growth. And growth starts with the seed.

The man who is "going to do some advertising next year—maybe" gets his advertising in the end in the shape of an obituary.

Don't lose your grip. Noah was 600 years old before he knew how to build an ark.

ANCHOR POST FENCES

are not the ordinary kind—they are fences of heavy galvanized netting erected on Anchor Posts—posts which won't sag or get out of line, and are galvanized both above and below ground to prevent rust.

In addition to fences and iron railings and gates of every kind we make tennis court, chicken-run and kennel-yard enclosures.

The Standard Documents of the American Institute of Architects

The New Contract Documents of the American Institute of Architects are now on sale and replace the old Uniform Contract, which is to be discontinued

PRICES FOR SINGLE COPIES

Agreement and General Conditions in cover	\$.10
Bond of Suretyship	.02
Form of Subcontract	.02
Letter of Acceptance of Subcontractor's Proposal	.01
Complete set in cover	.15

Trial set delivered upon receipt of nine 2-cent stamps.

These Documents have received the full approval of the Institute, through its Convention, Board of Directors and Officers. They are the outcome of nine years of continuous work by a Standing Committee on Contracts and Specifications. This Committee, comprising some of the ablest American architects, was assisted by the Institute's forty Chapters; advised by eminent legal specialists in contract law and aided by representatives of the Building Trade Associations of the United States. The forms have been officially approved by the National Association of Builders' Exchanges, the National Association of Master Plumbers, and the National Association of Steam and Hot Water Fitters.

FRANK C. GILLINGHAM & SON COMPANY

PHILADELPHIA

BUILDING LUMBER

On a Great Group of Concrete Buildings

THE huge plant of the Robert Gair Co. in Brooklyn includes four enormous structures of reinforced concrete and two old brick buildings.

One of these is the highest reinforced concrete building in the world and the group as a whole is the biggest single group of reinforced concrete buildings ever erected for one concern.

All the buildings, old and new, have The Barrett Specification type of roof.

The reasons for choosing these roofs were a desire to secure the best results at the lowest unit cost.

Just as the reinforced concrete walls take care of themselves

and involve no maintenance expenses, so the Barrett Specification Roofs cost less to construct than any other permanent roof covering and require no care or attention.

The Turner Construction Company, which built these reinforced concrete buildings, has constructed hundreds of other such structures throughout the country, and The Barrett Specification type of roof covers at least 95% of all the buildings they have erected.

Engineers, architects and builders know the sound economies of Barrett Specification Roof construction and usually prefer such roofs to any other kind.

Barrett Specification Roofs take the base rate of insurance and are approved by the Underwriters' Laboratories.

Copy of the Barrett Specification, with roofing diagrams, will be sent free on request. Address our nearest office.

*Barrett Specification Roofs on the Robert Gair Buildings, Brooklyn, N. Y.
Architect: William Higginson,
13 Park Row, New York City.
Gen. Contractors: Turner Construction Co.,
11 Broadway, New York City.*

Tar-Rok Sub-Floors (Tar Concrete)

This specification provides a method for building a wood floor directly on the ground without risk of dampness or decay of the wood. The plank is bedded directly in tar concrete excluding all air below, making a fireproof and extremely rigid construction. It costs much less than piers and heavy timbers and the extra excavation necessary to give air space beneath. The weight the floor will sustain is practically unlimited. Used for upwards of thirty years in many famous mills with perfect satisfaction. This specification is simply the best proved method for getting the desired results at a minimum cost. Booklet on request.

Velvex Creosote Shingle Stains

Preserve the wood and prevent decay.

The stains are made in every color and special tints can be matched if desired.

Booklet free on request.

Editorial Comment

Reports received from various cities throughout the country would seem to indicate that while the average of building expenditure remains high and conditions are, on the whole, encouraging, rather than otherwise, there is becoming noticeable a disposition to hold back on big work because of the sharp advance which has taken place in material prices.

Particularly is this the case with speculative enterprise, many operative builders declaring their determination not to break ground for work until there is a break in current prices. Brick, roofing material, lumber, all kinds of metal equipment, structural iron and steel, have advanced to a point at which builders say they add easily twenty per cent. to the average cost of construction.

The situation is made serious for the small operative builder by the attitude of the trust companies, many of which refuse to consider propositions for financing additional speculative ventures until it is apparent whether a demand exists for this class of structure at the necessarily advanced price.

The immense demand made by the munition industries on unemployed labor will, it is feared, cause a serious scarcity in labor, when, with the coming of settled weather, building activity gets into full swing.

* * *

In spite, however, of backward weather conditions, advancing prices and other drawbacks, building expenditures here in Philadelphia continue to maintain a nearly normal stability. According to figures compiled by William Gamble, Statistician of the Philadelphia Bureau of Building Inspection, the total estimated cost of all buildings, for which permits were issued during the month of March, was \$4,590,730. This shows an increase over February of \$2,152,980, but a decrease from the figures for March, 1915 of \$797,535. On the other hand, and by way of compensation, the first three months of the present year show in all an increase of \$1,170 over the corresponding period of 1915.

One hundred and fifty permits were issued for the erection of two-story dwellings, and 883 operations were begun, at an expenditure of \$2,103,000. Thirteen permits were issued for manufactories, whose estimated cost was \$660,000.

The following schedule gives the character of the operations and the estimated cost:

Character	Operations.	Estimated Cost.
Dwellings, 2-story	883	\$2,103,000
Dwellings, 3-story	36	192,655
Dwellings, frame	1	3,000
Stables	6	14,350
Manufactories	13	660,000
Workshops	9	52,500
Office buildings	3	222,450
Stores	7	36,000

Warehouses	4	119,500
Engine and boiler houses..	1	2,000
Churches	1	27,000
Schools	2	288,000
Hotels	1	60,000
Hospitals	1	70,000

A debatable point regarding the registration of architects was brought out by the report of the Committee on Legislation at the last convention of the American Institute of Architects. It is discussed in "Institute," in an article entitled "State Registration of Architects," by D. Everett Waid. He says in part:

"The report assumed that a registration law must be based on the power vested in the State to protect the public against unsafe buildings. It further took issue with most of such State laws, at least as they are being enforced, by assuming 'that public safety has no concern in those qualifications of the architect which enable him to practice a fine art, and that on such lines he should be no more subject to examination than is the painter or sculptor.'

"Whether the power which is founded on the right to protect life can be extended to protect the public against bad taste may be questioned, but such an attempt is made by refusing to admit to practice all who have not, in the opinion of the examiners, a proper knowledge of artistic design. That attempt is enforced by forbidding anyone except registered architects the right to file drawings and take out permits for building. Incidental abuses grew out of that law such as the case of a carpenter who, desiring to build a shed or shop, took his drawing to a licensed architect, secured the impression of his seal for \$5 and then was free to file his own drawing and obtain a permit.

"That such a law is drawn on a wrong basis is indicated by the fact that the Illinois law is now imperiled by legislation sought by the engineering profession in its behalf. If they succeed in their efforts the architects may be in worse condition than if no license law whatever existed.

"The New York law for registration of architects is drawn on a different theory. It is an educational measure and its most important or all-important object is to raise the standard of qualifications of architects and

thereby their efficiency and value to the public. Incidental to this purpose it prevents imposition on the public by providing that when it does employ an architect it shall be guaranteed some evidence that he is entitled to the name.

"But the New York law does not interfere with the right of any carpenter, builder, engineer, contractor or owner, to plan and erect any building for himself or others, provided he does not use the title 'architect.'"

"The building laws and the building departments charged with the enforcement of the building laws should protect the public against unsafe construction. The architect must protect the public against bad design by the merit of his own. It is the only possible way. The profession has no right and should have not wish to legislate business into its control. If we cannot command the respect of the public without legislation and cannot sell our brains to willing purchasers, then architecture is in a bad way indeed."

* * *

The New York "Sun's" competition for the best plans and design for a reasonable priced country home was won by J. Ivan Dise, a young New York architect who received his training at the School of Architecture of the University of Pennsylvania. He is the son of Joseph Dise, an architect, of Glen Rock, Pa., has been connected with the firms of Hamme & Leber, at York, Pa., and with Welsh, Sturdevant & Poggi, of Wilkes-Barre, Pa., before taking up his residence in New York City.

Two years ago, Mr. Dise won a prize offered by "The Brickbuilder" for a design for a \$5,000 fireproof house, and last year for an apartment house.

* * *

There was an interesting communication in the "Ledger" of Sunday last, from the pen of Mr. Charles Harris Whittaker, of Washington, D. C., under the head of "Less of the Fine Arts and More Craftsmanship." Mr. Whittaker thinks a great deal of the mischief wrought by modern teaching has its rise in the custom of referring to certain of the arts as "the fine arts."

"We suppose that it crept into the language as a more or less faulty definition of the word 'beaux' as applied to the arts in France," says Mr. Whittaker. "Each has produced a like result. They have succeeded in isolating certain of the arts and of setting up an artificial and apparently aristocratic, even snobbish, distinction. I do not find that any one is agreed as to what the 'fine arts' are. That is the only hopeful thing about the use of the word, since it offers no reason why we may not ultimately persuade its misguided sponsors to include all of the arts under the definition. Then we shall be back at our original starting point, which was and is the universality of art. Why not make the effort to reach that point, if it is desirable, by dropping the word 'fine'?"

"We have schools of fine arts, of industrial arts, of applied arts. Does anyone know why a school of painting should not be called a

'school of painting'? or a school of sculpture a 'school of sculptor'? or a school of textile designing a 'school of textile design'? It is true that there may be one school where several of these things are taught, but the difficulty of finding an honest title for such a school is not insurmountable. The value of such a title would lie in the fact that work would appear once more as something quite as respectable as art. The whole set of distinctions has the effect of making students believe that they are really not at work, but at art. What a condition!

* * *

"'Job' is a good word. It is better than 'task' or 'commission,' because it connotes labor and sweating of the brow and sleeves rolled up, and the joy of contact with a pliable or plastic medium, into which you may put yourself. Like its near relative, 'work,' it has lost somewhat in respectability of late. Well-meaning but foolish people have tried to set up a caste distinction under which the workman is no artist and the artist no workman."

"The architect, who is more widely dependent upon other artists and artisans for help, deplors the absence of that craftsmanship which was at the disposal of any builder less than a century ago. He realizes the effect of the centralization of industry, into which craftsmanship was absorbed and upon which it has been able to exercise scarcely any influence."

"He would like to revive craftsmanship. He longs for the return of the artisan who was also an artist. Yet one of the greatest obstacles to these desirable restorations lies in the attitude, generally speaking, of the architect himself. Having been taught and encouraged to think and speak of architecture as a 'fine art,' he unconsciously fosters the isolation of himself and his art from the workmen upon whom he is so dependent. In the days of great architecture there were no such isolations. The architect was able and willing to admit his fellow workers on an equal basis. He did not need to hand them elaborately detailed drawings of the ornamentation they were to chisel in stone. Yet as long as the architect is obliged to do this, and as long as he persists in calling his art 'fine' and thus setting it above and beyond theirs and yours and mine, just so long must he work in isolation; just so long must he deplore the lack of appreciation which to-day disturbs and discourages him."

"It would be idle to think that merely by ceasing to call his art 'fine' there would arise a band of skilled workmen upon whom the architect could rely. Not at all. But the first of the great barriers would be broken down and an intelligent appreciation of the conditions which now make it impossible for the architect to trust the workman, except here and there, would be possible. Nothing is possible in isolation. Everything may be possible in collaboration! For some of us do still believe that a common understanding of quality in men and things is more largely

possible even in a state where the individual has been submerged in the mob."

"If one care to pick up Parkyn's recent book on 'Prehistoric Art' one will be amazed at some of the exquisite line drawings of the paleolithic age. Russia to-day, with its uncountable millions of people who can neither read nor write, is full to overflowing of that capacity. In its traditions of folk song and dance, of untutored craftsmanship, of a peasantry completely detached from life in the large cities, there are sources which we seem to have dried up. May it not be that, even though the unintelligent use of terms was not responsible in the first place, the persistent and insistent use of them will only make difficult or even impossible the task of correcting the trouble? Words are strange leaders. They have been dividing the world ever since they were invented. Men are often united on a fundamental idea and driven far asunder by the words with which they try to clothe it."

* * *

Just what Mr. Whittaker's complaint is he fails to make altogether clear, but we take it to be that he is arguing for a closer understanding, as between the architect and the craftsman—a mutual recognition of their essential dependence—their equality of relationship to the finished work of art. The plea is not new.

HYDRATED LIME PLASTER.

The Hydrated Lime Bureau of the National Lime Manufacturers Association have issued a series of pamphlets concerning Hydrated Lime and its use. The titles are as follows:

Standard Specifications for Hydrated Lime, adopted in 1915 by the American Society for Testing Materials, Philadelphia, Pa.

Concrete Gas Tank Waterproofed with Hydrated Lime.

Tests and Uses of Hydrated Lime, by R. C. Haff.

Standard Specifications for Hydrated Lime Plaster.

Hydrated Lime for Use in Concrete.

Hydrated Lime Plaster for Scratch and Brown Coats.

Waterproofing Concrete with Hydrated Lime.

These pamphlets, which contain a large amount of useful and authoritative information, may be obtained by addressing the Bureau, Oliver Building, Pittsburgh, Pa.

"The Guide" is now covering Pennsylvania, New Jersey, Delaware, Maryland, Virginia and West Virginia, Ohio and Illinois. And it's growing, growing, growing.

Graham-Campion Co.

DEPENDABLE

BUILDING CONSTRUCTION

1215 Filbert Street

Philadelphia

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

MARYLAND CONTRACTS AWARDED

(Continued from page 239.)

40 feet, slag roof, steam heating, electric lighting, dumb waiters, gas ranges, refrigerator, fire escapes. Contract awarded to Consolidated Eng. Co., Calvert Building, Baltimore.

Stores and Apartments (alts.), 910 West North avenue, Baltimore. Architects, Sparklin & Childs, Law Building, Baltimore. Owner, Samuel Want, Calvert Building, Baltimore. Consists of general alterations, electric lighting, plumbing, tile work metal sash, steel stairs. Contract awarded to Singer Pentz Co., 600 Equitable Building, Baltimore.

Garage and Stable, Oak Forest Park, Catonsville, Md. Architects, Mottu & White, 322 North Charles street, Baltimore. Owner, J. W. McMillan, Montrose and Idlewild avenues, Baltimore. Stucco, 2 and 3 stories, slate roof, hot water heating, electric lighting. Contract awarded to Charles T. Leimbach, Catonsville, Md.

Warehouse, Woodberry, Md. Architect, Herman F. Doeleman, American Building, Baltimore. Consulting architect, James R. Edmunds, 908 Munsey Building, Baltimore. Owners, Wm. E. Hooper & Sons Co., 56 Maryland Life Building, Baltimore. Concrete and steel, reinforced concrete, hollow tile and stucco, 3 stories, 100x100 feet, slag roof, electric lighting, freight elevator, steel sash, steel rolling doors, fire doors, waterproofing. Contract awarded to Consolidated Eng. Co., Calvert Building, Baltimore.

Read "The Guide." Read it all through. Don't let a single item escape your notice. You'll be surprised what a lot of valuable information is crowded into its pages in the course of a year.

One secret that has been fairly well kept is the secret of success. Strange, too, when so many people are anxious to tell about it.

Permits for New Buildings

O is the abbreviation for owner. C is for contractor.

Philadelphia

Robert Cairns (O), 5135 N. Tenth street. Samuel Cairn (C), 5135 N. Tenth street. Cost, \$12,500. Six dwellings, brick and stone, 2 stories, 15x44 feet, Warnock and Duncannon streets.

Rev. Archbishop E. F. Prendegast (O), Eighteenth and Race streets. Wm. R. Dougherty (C), 1610 Sansom street. Cost, \$60,000. School, brick, 3 stories, 74x149 feet, Lancaster and Media avenues.

Dr. Geo. Woodward (O), North American Building. Wohlerton & Collins (C), 7930 Germantown avenue. Cost, \$16,500. Two dwellings, stone, 3 stories, 38x60 feet, Benezt and Cresheim Valley drive.

Klaus & Baxter (O), 5715 Ashland street. Robert Walsh (C), Thirty-third and Wallace streets. Cost, \$97,900. Fifty-two dwellings, brick, 2 stories, 15x38 feet, Sixty-second and Hael avenue.

Harry Cornelius (O), 5531 North Fifth st. Cost, \$2,500. Dwelling, brick, 2 stories, 16x48 feet, Second and Chew streets.

H. E. Perry (O), 4080 Frankford avenue. M. Ward Easby (C), 1420 Chestnut street. Cost, \$1,000. Storage, frame, 51x54 feet, 1 story, 40x80 feet, Frankford avenue.

Schlesberg & Cohen (O), 2534 North Hollywood street. Cost, \$43,900. Fourteen dwellings, brick, 2 stories, 15x40 feet, Sixty-second and Pine streets.

W. B. Davenport (O), 1346 Kerbaugh st. Cost, \$65,900. Twenty-seven dwellings, brick and stone, 2 stories, 15x40 feet, Tenth and Loudon streets.

C. L. Gahall (O), 809 North Broad street. D. Henwood (C), 1509 Wood street. Cost, \$11,250. Store and storage building, brick, 2 stories, 18x82 feet, Broad and Parrish streets.

L. H. Gilmer Co. (O), Cottman and Keystone streets. Smith Hardican Co. (C), 1606 Cherry street. Cost, \$12,000. Factory, brick, 3 stories, 50x100 feet, Cottman and Keystone sts.

F. Schilling (O), 220 N. E. Boulevard. Cost, \$15,000. Six dwellings, 2 stories, 15x39 feet, Mascher and Boulevard.

Carl A. Mayer (O), 5504 North Fifth st. Cost, \$9,200. Five dwellings, stone and brick, 2 stories, 16x43 feet, Third and Olney avenue.

F. F. Dorf (O), 5718 Cottage street. C. Taylor (C), 5912 Dittman street. Cost, \$2,900. Dwelling, brick, 2 stories, 16x55 feet, 3128 Van Kirk street.

Penn Realty & Const. Co. (O), 128 E. Walnut lane. Cost, \$48,000. Twenty-four dwell-

ings, brick, 2 stories, 18x28 feet, Twentieth street, at Sixty-fifth avenue.

Norman Castor (O), 1136 Foulkrod street. Rush Bros. (C), 1100 Fillmore street. Cost, \$7,200. Dwelling, brick, 2 stories, 17x45 feet, Arrott and Pilling streets.

A. & H. Bertola (C), 1950 Kalkerts street. Cost, \$3,600. Three dwellings, brick, 2 stories, 14x34 feet, 456-58 W. Mechanic street.

Robert MacDonald, Jr. (O), 7433 Spruce street. Howard Sowden (C), Ambler, Pa. Cost, \$9,000. Dwelling, stone, 3 stories, 29x42 feet, Roundfort road and Ardleigh street.

J. Glanzberg (O), 2021 South Eighth st. Cost, \$48,800. Thirty-fourth dwellings, brick, 2 stories, 15x31 feet, Oregon and Warnock streets.

Anna G. Day (O), 6125 Glenlock street. G. Day (C), Wissinoming, Pa. Cost, \$2,800. Dwelling, brick, 2 stories, 16x48 feet, Torresdale avenue and Benner street.

F. De Guglirimo (O), 3732 Mt. Vernon st. F. Palumbo (C), 521 Christian street. Cost, \$2,600. Dwelling, 3732 Mt. Vernon street.

Frank D. Williams (O), 1838 W. Venango street. Cost, \$2,700. Dwelling, brick, 2 stories, 28x30 feet, Bouvier and Pulaski avenue.

Wm. H. Ashton (O), 5612 North Second street. Cost, \$20,000. Nine dwellings, brick, 2 stories, 15x44 feet, 5600 North Mascher street.

Louis Boenig (O), 4933 North Fifth street. Cost, \$11,000. Five dwellings, brick and stone, 2 stories, 15x44 feet, Fairhill and Lindley avenue.

Thos. J. Ward (O), 3224 North Fifteenth street. Cost, \$64,400. Thirty-two dwellings, brick, 2 stories, 15x36 feet, Fifth and Bristol streets.

Geo. A. Mahn (O), 2736 Ridge avenue. Cost, \$74,800. Thirty-seven dwellings, brick, 2 stories, 15x38 feet, Thirty-second and Huntingdon streets.

John A. ostello (O), 4045 North Broad st. Cost, \$2,500. Dwelling, stone, 2 stories, 20x47 feet, 4829 Rising Sun lane.

Jas. F. Burns (O), 705 Cherry street. Koelle Speth Co. (O), Twenty-sixth and Oxford sts. Cost, \$18,000. Manufacturing building, brick and concrete, 5 stories, 37x80 feet, 705 Cherry street.

E. M. Harris (O), Twenty-second and Market streets. P. Haibach Cont. Co. (C), Twenty-sixth and Thompson streets. Cost, \$35,000. Garage, stores and office, brick, 1 story, 99x114 feet, Twenty-third and Chestnut streets.

Alterations and Additions

Heyman Bros. (O), Widener Building. I. T. Shoemaker (C), 1324 Walnut street. Cost, \$12,000. Store and warehouse, 802 North Broad street.

B. Fushery (O), 717 Walnut street. A. Barsky (C), 636 Pine street. Cost, \$1,250. Offices, 733 Walnut street.

Simon Miller (O), Sixteenth and Poplar streets. H. A. Streton (C), 1511 North Sixtieth street. Cost, \$1,000. Dwelling, Sixteenth and Poplar streets.

Dr. M. C. Hoade (O), Rising Sun and Magee streets. Wm. G. Isles (C), 1021 Gilham street.

Cost, \$1,700. Dwelling, Rising Sun and Magee streets.

Bradley Chain Works (O), 726 Richmond street. Robert Beatty & Bro. (C), 2321 E. Fletcher street. Cost, \$1,500. Chain works, Beach and Susquehanna avenue.

General Mfg. Co. (O), Swanson and Snyder avenue. H. P. Freund (C), Norristown, Pa. Cost, \$10,000. Factory, Swanson and Snyder avenue.

Mrs. S. M. Sykes (O), 1484 North Fifty-second street. LeRoy K. Smith (C), 4007

LABEL YOUR WORK

Signs 2 x 3 ft., 12c. Each

There is nothing more dignified or elegant than our large Weatherproof Fiber Cardboard Signs. Easy to carry, quick to place, not greasy, more serviceable than wood or iron, impervious to all weather conditions and cost from 8 to 20 cents apiece—in lots of one hundred.

INDEPENDENT PRINTING COMPANIES OF U. S. - Washington, D. C.

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., March 31, 1916.—Sealed proposals will be opened in this office at 3 p. m., May 15, 1916, for the construction complete of the United States post office and custom-house at Newport, R. I. Drawings and specifications may be obtained from the custodian of site at Newport, R. I., or at this office, in the discretion of the Supervising Architect. Jos. A. Wetmore, Acting Supervising Architect.

Labor means morality. The man who must work hard for a living has no time to run after other men's wives nor to constitute himself a receptacle for highballs. Only the laborers are religious. Leisure has ever been fatal to worship. It is useless to preach salvation to idle people. Remember the camel and the needle's eye.—"Onlooker."

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

****PRESSED METAL RADIATOR CO.**, Pittsburgh, Pa., announces the resignation of John K. Frye as president of the company. Mr. Frye will become general purchasing agent for the Donner Steel Co., of Bugalo, N. Y., formerly the New York State Steel Co., of which W. H. Donner is president. Mr. Frye will make his headquarters in Buffalo.

****NATIONAL ASSOCIATION OF MASTER PLUMBERS** has arranged to hold its next annual convention in Atlantic City, N. J., the dates being June 20-22. Headquarters will be at The Breakers, the new name for the remodeled Hotel Rudolf.

****NATIONAL EXPOSITION OF SAFETY AND SANITATION** will hold the third annual exhibition at the Grand Central Palace, New York City, during the week of April 17, 1916.

****KEASBEY & MATTISON CO.**, pipe covering and asbestos material, will move its New York offices about May 1, from 100 John street to the new Astor Building at Broadway and Vesey street.

****GEORGE K. PARSONS**, consulting engineer, has located his main offices in the Equitable Building, 120 Broadway, New York City. Mr. Parsons will continue his office in the Riggs Building, Washington, D. C.

****FEDERAL RADIATOR CO.**, New Castle, Pa., has appointed George W. Barr Eastern sales manager, with headquarters at 1402 Land Title Building, Philadelphia, Pa. The company manufactures both boilers and radiators. Mr. Barr was formerly Philadelphia manager of the United States Radiator Corporation and has long been identified with the heating trade.

****THE ALIGNUM PRODUCTS CO.**, of 103 Park avenue, New York, have issued an announcement containing scale drawings showing the construction of Alignum fire doors for fire walls.

****J. J. BLACKMORE**, for the last two years secretary of the American Society of Heating and Ventilating Engineers, has resigned to take up the management of a new boiler and heater department for the J. L. Mott Iron Works.

****NATIONAL HOUSING ASSOCIATION** will hold the next housing conference at Providence, R. I., October 9-10-11, 1916.

****KLEIN & NEWMAN**, 489 Howard avenue, Brooklyn, desire catalogues and samples from jobbers and manufacturers in the heating and plumbing supply business.

COMPETITION IN WORKINGMEN'S HOUSES.

A competition in houses for workingmen involving plans, sketches, grouping and arrangement has been announced by the National Americanization Committee with the co-operation of various societies and institutes of architects and engineers. Prizes aggregating \$2,100 are divided into two groups, the first of which covers plans for the housing of workmen in industrial communities not exceeding a population of 35,000. Entries of this class include plans for: First, single family houses; second, combined family and lodging houses which will permit separation of the family from the lodgers; and third, boarding houses or community dwellings for numbers of single men or of single women.

In the second group two prizes are offered for a satisfactory substitute for the derailed freight and cattle cars now used to house construction gangs on railways.

The aim of the contest is to arouse interest in the subject of the housing of workmen in industrial communities and to produce carefully worked out and entirely practicable housing plans and standards which it will be

possible for employers and workmen and communities alike to demand and insist upon.

Inquiries concerning the competition should be addressed to the National Americanization Committee, 20 West Thirty-fourth street, New York.

ADVANCE IN COST OF BLUE PRINTS.

According to present tendencies it would seem that the price of blue-print paper and blue prints is likely to advance in the near future, due to the increase in the price of all chemicals used in the blue-print process, as well as to the heavy advance in paper. As is well known, blue-print paper is coated with an emulsion of iron and potash salts, which are combined by the action of light, and upon immersion of the paper in water the coating is precipitated on the surface of the paper in the form of Prussian blue.

According to the New York "Commercial," red prussiate of potash, which is the form of potash used in the blue process, has been made exclusively in Germany. Before the war it sold for 19c. a pound; to-day it is practically

unobtainable at \$7 per pound, or an advance of 3500 per cent. Citric acid, from which the citrates of iron and ammonium are made, has advanced 150 per cent., and oxalic acid, from which the oxalates of iron are also made, has advanced 1000 per cent. in the same time.

THE COST OF USING STEEL FORMS

When steel forms are leased and returned they cost 30 cents a square foot, according to Leonard C. Wason, of Boston. With wood, on the average, 3 cents per superficial foot of contact is the cost when used four times. Thus it is necessary to use steel forms ten times to bring the average material cost down to that of wood. But with wood the forms are so much shaken and damaged that after three or four uses they are practically worn out and have to be replaced. Steel forms have been used more than thirteen times on one job.

"We have never used steel forms to destruction," says Mr. Wason, "although we have used them thirty times. Probably forty-five uses is a conservative estimate of their life. During this period 3 cents per square foot may be spent for upkeep, and when they are worn out the same 3 cents can be obtained from the metal as junk. If the forms are bought at 45 cents a square foot instead of leased at 30 cents, the cost per use would work out finally at 1 cent, to which should be added 1/2 cent for wedges and keys. This total is just half the cost of wood."

LOCAL ASSOCIATIONS FOR CONTRACTORS.

The electrical contractor is coming to realize more and more the value of organization. This is manifest, says the "Electrical Review," not only in the activities of the National and State associations, but in many local organizations which have helped to weld together the interest of local contractors and prevent the antagonism and reckless price cutting which has often occurred in the past, leaving a record of disaster in its wake. The electrical contracting business has had to meet problems common to a number of other industries and trial has usually shown that these problems can best be handled by co-operation, whereas the individual can do little to improve local conditions. It sometimes seems to be a slow matter for such associations to accomplish anything, but it is really necessary first of all for men to get acquainted before they can achieve much in the way of co-operation, and there must be a real intent to achieve something, which will stimulate a desire for participation in association activities.

THE EMPIRE STATE.

No one can gainsay that New York is the Empire State. Twenty-four per cent. of all the persons paying the United States income tax live in that State, and 60 per cent. of those who pay on incomes of half a million or more, according to statistics.

Chanelath RIBBED EXPANDED METAL

"Chanelath" is a new expanded metal product consisting of T-shaped ribs $\frac{7}{8}$ inches high, spaced 4 inches apart and joined together by an expanded metal fabric of small meshes as shown in the illustration.

"Chanelath" is specially suitable for all kinds of plastering work where auxiliary studding or furring is required for the T-rib acts as a studding or furring.

"Chanelath" is also designed for use as a combined form and reinforcing in the construction of concrete roofs and floors. In this work the fabric acts as a form and also as a reinforcing, but the greatest reinforcing value is in the T-rib.

Prices and complete data furnished by us.

Editorial Comment

In spite of the general complaint regarding the advance in the cost of labor and material, there is one class of builders reported busier than they have been for many years. That class is the reinforced concrete specialists, who are reported figuring on new work in nearly every section of the country. The popularity of this structural medium for shop and factory buildings is growing yearly. Fortunately for the reinforced concrete element the major demand seems to be just now for buildings of the industrial type. As a result, men who specialize in this class of building are reported to be facing a season of unusual promise.

* * *

There is a falling off everywhere observable in dwelling work of the operative type, due largely to the unwillingness of capital to make loans for this class of work in face of the upward tendency of material costs. And while this condition is bound to be to some extent alleviated by the coming of mild weather with a nearly normal demand for new and moderate-priced homes, trust company officials are reported to be disposed to wait and see how the buying public takes to the approximately twenty-five per cent. advance in prices before backing additional ventures of the kind on an extensive scale. Operative builders who have gone ahead with their projects report a fairly active demand even at the increased prices, so that it is probable that good weather may see this class of building up to somewhere near normal figures. Here in Philadelphia whole blocks of operations are tied up because of the action of Councils in authorizing the construction of \$300,000 worth of sewers for which no appropriation is available. Real estate men aver that not less than a half million dollars' worth of work is held up by this cause alone.

For many months Councils have been passing ordinances calling for the laying of pipes in newly dedicated streets. Real estate operators looked upon the ordinances as assurances that the sewers would be constructed, and began several operations in outlying sections of West Philadelphia. At the present time the city's financial condition is such that no one can tell when the sewers will be laid. If the operators try to settle the difficulty by laying the pipes themselves they will be forced to expend from \$6 to \$10 per running foot. If the city laid the pipes the cost to the operators would be only \$1.50 a running foot for each side of the street.

A delegation of operative builders that waited upon the Mayor recently to ask relief from this condition were promised every official co-operation, but owing to the existing financial muddle and to factional disturbances in Councils, the outlook for prompt action is looked upon as anything but encouraging.

* * *

New York advices are to the effect that

the Compensation Law is also figuring to some extent in the higher cost of doing business.

"As the insurance premium is eventually shifted, in theory at least, to the general public, in some of its aspects the law is not unfavorable to employers. Nevertheless, it means something more added to the cost of construction, and therefore it is reputed to be playing a part among the considerations which are deterring some builders from making a start."

* * *

An article by Herbert S. Swan, in the New York "Record and Guide," summarizing a report prepared for the National Municipal League, presents with unusual clearness and force the wisdom, from a city-planning viewpoint, of the principle of excess condemnation.

"The case for excess condemnation rests primarily upon two considerations: the reploting of remnants and the control of land adjacent to improvements," writes Mr. Swan.

"The importance of this power as a means to obtaining a convenient and well-considered plan, especially in the older and built-up sections of a city, can hardly be overestimated. The wisdom of many a street improvement hinges upon the exercise of excess condemnation. The land adjacent to a street is generally divided into plots, the shape and size of which are adapted, as well as might be, to the street's present use and condition.

"When Delancey street (New York) was widened to provide for the bridge approach, a tapering strip, with an area of some 90.8 square feet, was left extending along the street for more than a hundred feet, with an average width of 10 13-16 inches. Several other strips less than 10 feet in width were left fronting along the widened thoroughfare for an equal distance. These strips robbed the lots adjoining them in the rear of their natural frontage on Delancey street.

"The following are a few examples of plots left by improvements actually made in New York City: At the corner of Elizabeth and Delancey streets, a triangular segment, 9.10 by 1.51 feet in dimension, or 6.87 square feet in area; between Mulberry street and Cleveland place on Delancey street, a segment, 1.47 by 8.98 feet, or 6.59 square feet in area; between Barclay and Vesey streets, on West Broadway, a segment, 2.6 by 13.5 feet, or 17.27 square feet in area; on Prince street and Flatbush avenue, one 4.3 by 10.3 feet, or 21.96 square feet in area; on Lafayette avenue and Flatbush avenue, one 1.7 by 6.4 feet, or 5.28 square feet in area, and on Lafayette and Pearl streets, one 4.8 by 9.2 feet, or 21.63 square feet in area.

* * *

"It is self-evident that the utility for commercial purposes of the lots fronting on these street extensions and widenings is greatly im-

paired. Lots which, if united under single ownership, would afford sites for substantial business blocks commensurate with the importance of the street and which would bring in large rents are now on or very near the margin of no-rent land. They are so small and irregular in size as to be totally unfit for improvement. 'There are streets in New York to-day,' says Tax Commissioner Lawson Purdy, 'which have been widened for ten years, but still look as though they had been devastated by an earthquake. The reason is that when the map is inspected it is found that there are all sorts of small bits of land in separate ownerships, just as they were when the street was widened.'

"Since each parcel, by the mere fact of its adjacency, commands the values of the neighboring plots, every owner becomes, as it were, a monopolist. Knowing the strategic position of his own remnant and that its union with its neighbor would immediately, without any effort on his own part, result in a greater value than the sum of the two separately, each proprietor overestimates the true importance of his own plot and shrewdly bargains to get not only the proportion that his own parcel contributes to this increased value, but also as much more as he is able to wring from the purchaser. Not succeeding in his designs by legitimate means, the owner, if he be unscrupulous, sometimes erects so objectionable a building on his land or puts the land to such use as practically to coerce the adjoining owner into either purchasing it at an exorbitant price or selling his own at a great sacrifice. A limited power of eminent domain often serves to make the ultimate development of the city dependent upon petty jugglery. In some instances, remnants owned by estates may be so tied up as to make it impossible to sell or develop them."

* * *

"Until a concentration of ownership takes place, the ripening of the unearned increment is held in abeyance; if the separate parcels are never united, it is completely stopped. Sometimes the increment which would naturally be expected is never enjoyed by anyone to its full extent, and the city, which creates the benefit, reaps none at all. Even though the property owners are deterred from realizing upon the unearned increment, they are nevertheless obliged to pay the special assessments levied to pay the cost of the improvement. Excess condemnation not only relieves the land owners from this burden, but accelerates the city's growth and prosperity by insuring the quick and sure development of its thoroughfares.

"The advantage of control over the character and use of the buildings fronting on an improvement also justifies excess condemnation. By placing suitable restrictions when reselling the surplus land, the city will secure harmony in the treatment of streets.

"The question is largely one of municipal aesthetics. The effect of an improvement is to a very considerable extent dependent upon the beauty of its surroundings. To secure the greatest harmony, it is necessary that each

building be designed with regard to the general final result.

* * *

"Leaving shallow and misshapen remnants in the possession of private owners hampers the city's economic advancement. As much can be said of its aesthetic development. Frontages which, if connected with adjacent land, would furnish sites for substantial and ornamental structures are now occupied by ugly shanties or billboards.

"If our cities are ever to be consistently beautified, it is certain that the State will have to take a hand in the matter. Leaving the unrestricted choice of structural material, height and use of building and design of facade to the owner means anarchy in architectural treatment. Were it not for the failure of our courts in most instances to recognize aesthetic considerations as a ground for exercising control over property, such statutory regulation would be far preferable to the indirect and cumbersome procedure of excess condemnation. It is not likely, however, that such regulation can be made available in this country in the near future, nor is it to be expected that architectural control will ever, except on the rarest occasions, be the primary motive for exercising excess condemnation. Americans have so little appreciation for the aesthetic city.

"Recoupment through excess condemnation and the subsequent sale of excess lands at an enhanced value is justified on essentially the same grounds as the tax on unearned increment. The increased value being a growth exclusively due to the enterprise and initiative of the community, it is entirely proper and just that the city, and not the property owners abutting on the improvement, should obtain the benefit.

"A lot often has what may be called an integral or unit value, and, so far as cost is concerned, it matters little, if at all, to the city whether the whole or only a part is taken. This is especially true of improved land. Where part of a structure has to be taken, the city is invariably obliged to pay for the whole. In such cases, the city might utilize recoupment to exceedingly good advantage. As the initial cost of the improvement would not be augmented by such extra takings, the sums realized by their sale would be clear profit.

* * *

"In the period between 1889 and 1913 the London County Council exercised the power of excess condemnation in forty-five street proceedings. The aggregate gross cost of these improvements was \$44,246,125. Of this amount, \$23,511,740 was recouped through the sale of surplus lands, reducing the total net cost to \$20,734,385. In other words, the monies received from recoupment amounted to 53 per cent. of the total gross cost and to 113 per cent. of the total net cost.

"The per cent. recoupment obtained is proof that the power of excess taking has in the majority of improvements been exercised only incidentally for pecuniary profit. In thirty-one of the forty-five improvements effected

with excess condemnation between 1889 and 1913, the recoupment realized was less than 10 per cent. of the gross cost; in four between 11 and 20 per cent.; in two between 21 and 30 per cent.; in four between 31 and 40 per cent.; in two between 41 and 50 per cent., and in two over 50 per cent.

* * *

"The most notable instance of recouping in recent years is the Holborn-Strand, or Kingsway improvement. It was considered for many years by the Council, but was not undertaken until 1899. The total area of the property dealt with was 28 acres, of which 12¼ were dedicated to the public in the form of new streets, leaving 15¾ acres available for building sites. The length of the street is 1,100 yards, the width 100 feet. The total gross cost of the improvement was about \$24,330,000. Through a recoupment of \$20,459,000 the net cost has been reduced to \$3,871,000. The recoupment is, therefore, 84 per cent. of the total gross cost.

"The percentage of recoupment obtained in making improvements will vary with the amount of land taken in excess of that required, the general shape and size of the parcels, the character of the neighborhood through which the thoroughfare is cut and the honesty and good judgment with which the scheme is carried out."

* * *

Pretty good case for the wisdom of excess condemnation, don't you think?

THE STANDARDIZATION OF BUILDINGS.

"The standardization of buildings, especially factory and commercial buildings, is a probability of the future," according to an exchange. "Lecturers at Cornell University have claimed that standard sizes, standard details and standard materials will make possible not only exceedingly rapid construction and reduced costs to the owner, but also increased profits to the contractor. The idea of shipping to Europe after the war complete buildings in parts, made in America (much in the same way as we are shipping submarines in parts) is in the mind of certain firms of engineering contractors. The owner will select one of half a dozen standard buildings, the steel frame, floor slabs, steel sash and complete equipment for which are kept in stock, and will get 30 to 90-day deliveries of the completed structure. Even now, with modern efficiency methods, and without noticeable standardization, great hotels and office buildings are erected with almost unbelievable rapidity.

SERVICES OF AN ARCHITECT

The thinking public is awake to the value of the services which an architect is capable of rendering, and recognizes that his province bears the same relation to the owner as that of a specialist in medicine or surgery to his patient. In countless ways the expert advice and suggestions of an experienced architect will be found to have substantial value, and his worth, in this respect, cannot be economically ignored by anyone who has determined to build, whether it be a bungalow or a great commercial or monumental project.

When a location is in contemplation, or has been determined upon, the architect selected should be made acquainted with the owner's ideas and conception of what the building should be, and its character and purpose. The exigencies of the site should then be studied, and the climate, outlook, grades, drainage and other essential factors carefully considered, as their influences make for the success or non-success of the completed building.

This will enable the architect to obtain a knowledge of the essential requirements, to discuss any fallacies, and to sketch out practical and comprehensive plans for the interior arrangement and exterior design, organized and adapted to the real need and precise conditions that underlie the problem. These preliminary studies may offer several solutions, each advantageous from one point or another, which may be intelligently discussed with the client and lead to definite conclusions.

From these sketches and studies showing the general plan and design of the building contemplated, with their accompanying synopsis of the materials of construction, fixtures and finish, close approximate estimates may be obtained from contractors. These estimates afford a basis for determining the future possibilities of the project and enable its further development by the preparation of the final working drawings, which involve an accurate layout of all the floors, all the elevations, both exterior and interior, also typical sections and details of the methods of construction. The working drawings must be so complete that a contractor will know exactly how and of what material every part of the building is to be constructed, thereby forestalling any guessing, which so frequently is costly to the owner.

The working drawings are accompanied

by specifications, taking up in the form of a description what it is impossible to express on the drawings, and stating therein with clearness and precision the grades and character of the work, materials, ingredients, appliances and fixtures required to be used and installed. These specifications also show how the contractor shall do certain portions of the work and co-operate with the various sub-contractors; they also state the indemnity bonds, insurance, etc., required; and, in general, form a complete thesis of the building to be constructed, leaving no doubt in the mind of the contractor as to the exact amount and character of the work called for. This assures that all estimates received shall have been intelligently submitted, and that, when the contract is ultimately awarded, the contractor can plan its progress with a definite knowledge of the materials and requirements, the work being thus carried out with greater expedition and consequent economy.

When it is decided to begin work, a legal, binding and definite contract must be prepared by the architect, in which the requirements on both sides are clearly set forth; the "instruments of service," in the form of specific and technically intelligible drawings and specifications, being made a cohesive part of this contract. Definite terms of payment, time of completion, and requirements in connection with lien laws must be provided for. There must also be provision in the contract for fire, lightning, casualty, compensation and contingency insurance, also for necessary bonds in connection with completion, and for compliance with local, municipal or State requirements, departmental directions or rulings, ordinances and acts.

After the contract has been awarded, the architect should be placed in full charge so as to enable him to direct and observe the proper laying out of the work and to see that plans and specifications are conformed to. He must also make proper disposal of the problems that arise while the building is in progress, passing on all technical questions and furnishing from time to time explanatory detail drawings of the various parts of construction, ornamentation, fixtures, arrangements, etc., as required. He issues certificates of payment as they fall due under the terms of the contract and also becomes the arbiter in all questions of dispute.

It is only by following these steps, in their

logical, natural sequence from the very conception of the building to its completion that an owner can obtain the best results with a minimum of worry and a maximum of economy.

In order to construct a building successfully, it is necessary to anticipate each step in the progress of its development and to outline a complete system for its erection and to control the work until the building is turned over completed to the owner.

Full architectural services, rendered by a competent man, will save many times his comparatively small compensation. The instruments of service, the plans and specifications, are the fundamental elements in the contract, and to produce them requires thought, experience and learning, also familiarity with the qualities, properties, peculiarities, weight and strength of materials, the weights of the structure and the relationship of the various operations to be performed by the many trades in the building.—C. E. Schermerhorn, A. I. A., in "Architecture and Building."

Philadelphia is one of the busiest building centers in the United States and "The Guide" is the only medium that touches this golden field.

Be a booster. Boost business, boost the trade, boost your own goods. And don't overlook the fact that the greatest medium ever devised for the boosting process is printer's ink.

The world is just chock full of men who failed because they expected buyers to romp right in and ask for goods. Modern business spends big money simply to get the buyer interested knowing that sales follow.

Proposals

Bonds. Improvements. Equipment.

As the Home Office and Headquarters of the Most Important Financial, Railroad, Engineering, Structural, Manufacturing and Equipment Firms in the United States, Pennsylvania offers a Particularly Rich and Productive Field for "Proposal" advertising. "The Builders' Guide" is the Only Medium in this Field.

SEALED PROPOSALS.

TREASURY DEPARTMENT, Supervising Architect's Office, Washington, D. C., March 31, 1916.—Sealed proposals will be opened in this office at 3 p. m., May 15, 1916, for the construction complete of the United States post office and custom-house at Newport, R. I. Drawings and specifications may be obtained from the custodian of site at Newport, R. I., or at this office, in the discretion of the Supervising Architect. Jos. A. Wetmore, Acting Supervising Architect.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

**H. W. Johns-Manville Company recently honored a group of men who have been instrumental in the upbuilding of the concern and in the direction of its policies, by making them directors at the annual meeting of the stockholders. The following men were elected to the Board of Directors: L. R. Hoff, W. R. Seigle, T. T. Lyman, H. R. Trainer, Harry Gillett, F. B. Smith, J. E. Meek, H. R. Wardell and J. W. Perry.

**The New York State Association of the American Institute of Architects held its annual convention in Albany, February 24. Delegates representing the various chapters throughout the State were present. The New York delegates were Goodhue Livingston, Kenneth M. Murchison, Austin W. Lord, Arnold W. Brunner, Thomas Hastings, J. H. Freedlander, E. L. Tilton, William M. Kendall, Donn Barber, F. L. Ackerman, J. Otis Post, L. C. Holden, Grosvenor Atterbury, Owen Brainard, William R. Mead, Henry Bacon, William Emerson, Lawrence F. Peck, D. E. Waid, William A. Boring, A. B. Trowbridge, Chester H. Aldrich, Lionel Moses, Egerton Swartout, Louis Ayres, Richard H. Hunt, Charles I. Berg, Lloyd Warren, Stowe Phelps, Charles Ewing, Bertram G. Goodhue, B. W. Morris, George B. Ford and Robert D. Kohn. The Brooklyn delegates were William P. Bannister, Carroll H. Pratt, J. T. Hanemann, George H. Streeton, Alexander Mackintosh, Woodruff Leeming, Stephen W. Dodge, Frank H. Quinby, William A. Parfitt and Frank J. Helmle.

The following officers were elected: Frank H. Quinby, of Brooklyn, president; E. S. Gordon, of Rochester, vice-president, and Edward L. Tilton, of New York, secretary.

The convention adopted resolutions protesting against the Government heat, light and power plant, the erection of which has been started on the Potomac River, near the park in Washington, D. C. The resolutions in part are as follows:

"The New York State Association of Architects, comprising the four Chapters of the American Institute of Architects, within the State of New York, hereby registers an emphatic protest against the proposed erection of a power station on the selected site near the Potomac River, in the City of Washington, and recommends that before the work further proceeds, the National Art Commission should make a thorough investigation into the matter, obtaining competent advice and give adequate consideration to the sites more appropriately located which will avoid offending the artistic sense of the people of the nation.

"Be it further resolved that: Copies of this protest be sent to the Legislative Committees now having the matter under consideration and to the press and that the constituent members of this Association employ every reasonable effort to emphasize the importance of radical action to bring about the selection of a more appropriate site."

The association will keep in close touch with the situation and send a delegation to Washington to protest against the site as selected for the power station. A committee was appointed to prepare a basic building code for New York State covering the construction of buildings other than factories.

**The losses by fire in the United States and Canada during the year 1915, as compiled from the records of the "Journal of Commerce," aggregated \$182,836,200, as compared with \$235,591,350 in 1914. The fire loss record for 1915 is the smallest the country has enjoyed since 1905, when the figures recorded were \$175,193,800.

**At the recent annual meeting of the Master Builders' and Contractors' Exchange, Reading, Pa., held in the rooms of the Chamber of Commerce, officers for the ensuing year were elected as follows: President, D. Elmer Dampman; vice-president, David E. Gring; treasurer, Daniel H. Hunter; secretary, Howard C. Faust. The secretary reported that most of the contractors and builders in Reading are associated with the Exchange and plans are being made to bring in all those now outside the organization.

CEMENT RATES FROM NAZARETH REDUCED.

The Public Service Commission has handed down a decision ordering the railroads carrying cement from what is known as the Nazareth cement district to reduce the rate from Nazareth to Easton, Bethlehem and South Bethlehem from 63 cents to 53 cents per ton.

A complaint was filed with the Commission by Dallett H. Wilson, of Bethlehem, attorney for the cement companies, to equalize the rate from what is known as the Nazareth cement district with the rates in existence from points on the Ironton Railroad and also points in the New Jersey district. At the time the complaint was filed the rate from the Nazareth district was 63 cents, as against the rate of 53 cents from the Ironton or Lehigh and the New Jersey districts.

HOME BUILDERS TO HAVE STATE AID.

Home builders may now have State aid. This is the plan of a new and unparalleled service which the Minnesota State Art Commission has undertaken. It is a radical departure from the usual channels of most art commissions which are supposed to dabble in pictures, statues and pretty things. The State Art Commission of Minnesota has turned the tables. It has taken a different point of view. It has said, "Most States help hogs and hay, why not homes?" It argues that art is a bigger and more vital thing than just pictures, that it relates to homes and home building.

If the chimney smokes or the plumbing balks, or the furnace fumes, all you have to do is to write the Art Commission. This appears a long way from the duties of an artist, but it is merely a step in the development of a great State-wide campaign which the State Art Commission has undertaken to help home builders.

One million plans for model farm houses have been sent free in booklet form from the offices of the commission in the past twenty-four months. No other State Government has as yet undertaken such a program. These plans were all given by the best architects in the State. It was their contribution to help the small home builder secure authentic and professional service practically free. The Art Commission has been deluged with requests for not only plans, but information about all sorts of home building material. People want to know what kind of paint, cement, furnace to use, and a thousand other similar questions. The Minnesota Chapter of the American Institute of Architects has undertaken to render this service free through the Art Commission as an outlet. It is known as the architectural and allied arts service department. It is open to the people of the State—in fact, is extended to any one living anywhere who is interested in securing authentic information about plans, building materials and supplies.

The commission supplies the plans for both model farm and village houses at just the cost of making the blue prints. It is printing fifty model village houses that are designed to cost \$3,000 each. These are beautiful and attractive small homes and have been given by the architects. It is not a profit-making venture. It is a State service in the interest of better homes. It is a service that people can have for the asking and it is making history for an art commission that has the courage to look a hard, matter-of-fact problem in the face and meet it by giving this service. A letter addressed to the Minnesota State Art Commission, Old Capitol, St. Paul, or 504 Essex Building, Minneapolis, will bring complete information about this new service which is intended to help the small home builder.

"Do what you are paid to do—and then some—it's the then-some that gets your salary raised."—James B. Miller.

OLD NEW YORK STREET NAMES.

There have been changes in the names of many of the old streets of New York, though seldom for the reason Bowery business men are advancing in support of their campaign. Dutch names were generally abolished when the British took possession, and several of the English names disappeared after the Revolution. Liberty street was formerly Crown, Pearl was Great Queen, Broad was popularly known as Petticoat lane, and Broadway above the vicinity of Wall street was Great George, while that section in front of Trinity Church was called by the British officers The Mall. And Columbia College was King's College previous to 1784, as a plate in front of the university library testifies.—New York "Sun."

"Do what you are paid to do—and then some—it's the then some that gets your salary raised."—James B. Miller.

Editorial Comment

An article from the pen of Theodore Starrett, in the March number of "Architecture and Building" presents some interesting data concerning the building of the Remington Arms plant at Bridgeport, Connecticut. How big the job was is best told in Mr. Starrett's own graphic style:

"I am under the impression that it is the biggest thing of its kind in the world, that is, buildings of the many-storied type, all new—all built at the start, as distinguished from a plant which has grown year after year," writes Mr. Starrett. "One man that I know took a fourteen mile walk looking this new Remington plant over. The buildings themselves cover about twenty acres of the ground and the rest of it is terraced and graded, not to an accompaniment of flowers and sod, but with retaining walls of railway embankments and a concrete dam forming a lake whose exact area is 7.57 acres, with a few miles of road and a small front yard—very small relatively speaking. This front yard is sodded and traversed by walks so as to hide every single square foot of what had been the barren hillside that once was there.

"Not a single square yard of those whole thirty-five acres but has been transformed by the work of man. Buildings, many-storied—not sheds—fireproof, modern in every way, in fact the very last word in construction, and so large as almost to strain the imagination, cover, as I said, twenty acres of this ground. One of them is over 2,000 feet long. Some folks would say it was fourteen buildings joined together and each one of them 'no slouch' of a building.

"And the whole thing was done in seven months and twenty-six days. Call it eight months. And all the people in Bridgeport to witness; and thousands of others, for people have gone miles to see it.

"And the whole thing was designed while it was building. That is one of the most interesting things about this wonderful example of twentieth century American executive ability."

* * *

"Imagine that hillside along that ditch. Thirty-five acres of rough hillside, of boulders, clay and solid granite. A single track, light built, dummy railway along the edge of the brook. Now there are six tracks of heavily constructed, well ballasted railway. The 'right of way' looks like the main line of the Pennsylvania Railroad out near Pittsburgh, where the same builders who built this work have a monument of two.

"But I was saying, imagine that hillside and understand that the hill is gone—cut down at the top and built up at the bottom. The front yard looks like a little park that had taken years in growing. Yet eight months before the last picture shown here

was taken they were just beginning to excavate.

"With no definite notion of just what was to be done, but with the idea of a certain plan and type of construction desired, the owner turned the rough hillside over to the contractor and together they worked it out. I am sure a lot of midnight oil was burned thinking out and planning the day's work for this job.

* * *

"Their big stunts, like this Remington job, for example, are organized in the face of difficulties that are great, to say the least. One of these difficulties is the temporary character of their army as I will call it. Of course the staff is permanent, or can be, but the rank and file are nomads. The succession of different classes of operation from excavating at the beginning to, say, painting at the finish, with one gang for the start then a dozen—no, forty different gangs—different trades—succeeding each other with perhaps ten to twenty on the job at the same time—the temporary nature of the employment of individual workmen on this or that operation—this is only one difficulty.

"No building organization has ever been, nor till the Millennium ever will be, free from this difficulty.

"And there are others—which I will not mention.

"The apex of activity on the Remington plant saw 3,500 builders at work. At that time one hundred cars of material per day were brought upon the job, unloaded and switched out to make way for more cars, and so for a period of approximately two months.

"Did you ever see a train of one hundred cars? Did you ever see one of fifty cars? Do you realize what it means to put material into walls and floors and roof at the rate of one hundred car loads per day? I do. I have some conception of what it means."

* * *

"The general contractors, to whom the major portion of the credit is due for the Remington job is James Stewart & Company, Inc., of 30 Church street, New York City.

* * *

Harvey M. Watts is of opinion that the real underlying reason why American architects turn almost sub-consciously to the classical models, when the commission is one that calls for a structure in which dignity and beauty is to be blended, is because of the irresistible appeal which the old forms are still capable of making to the imagination of the average man.

"Just why we like these forms of architecture from the olden, so that few enter the great waiting room of the Pennsylvania Station in New York without having an uplifting sense of the 'grandeur that was Rome's'—

for it is an almost exact copy of the typical vaulted hall of a Roman bath, which was a club, public library, hotel, a gymnasium and palace all rolled into one—is again being asked these days, not only here, where the art gallery is still being criticised by those who 'want something else,' but in Congress and other legislatures where there is the eternal querying as to 'why the Lincoln Memorial should be built in the style of the Parthenon,' or why architects should go to the Forum for their inspiration when they would build triumphal arches," writes Mr. Watts. "Despite all the bucolic iconoclasm of the farmyard school of critics, which would even have us develop an 'American style of architecture' and throw off the bondage of the Old World and the classic period, and despite the rude virtues which so many Congressmen seem to think lie in dubbing a Greek temple or an Italian palace 'un-American,' the fact is the architectural world of America was never in stricter accord with the great achievement of the Italians than now. What the World's Fair at Chicago began in 1893 was continued at St. Louis and elsewhere at all the intermediate exhibitions, and has been again confirmed by the architecture of the superb buildings at the San Diego and San Francisco expositions. Hence, when any one asks why this return to the 'classic,' using the word broadly, it would seem the answer is that it is a return to the fundamentals that have the deepest human appeal.

"Hence, it is not only the most natural but the inevitable thing that the new art gallery here, and this is also true of every art gallery built recently or remodeled anywhere in the country, should be severely 'classical' in style. The 'splendor that falls on castle walls' is one thing, but the splendor of moonlight or sunlight that falls on great masses of ordered masonry with pillared porticos seems to grip the average individual of the twentieth century very much as it did the Egyptians 5000 B. C., the Roman or the Greeks."

* * *

"Explaining how the rigid following of the rules of some of the old authorities had given the Romanticists a chance to attack the classic architecture as 'imitated, academic and unalive,' which was the attitude of many in the eighteenth century, Geoffrey Scott points out that it was the spirit and the life which the Italians put into their application of the older architecture to the needs of their day that carried everything before it then, as it seems to be doing to-day with us. As he puts it:

"An art is academic in this harmful sense when its old achievements crush down the energies that press toward the new. But the academic canons of the Renaissance did not represent the past achievements of the Renaissance, but of antiquity. To the Renaissance they were the symbol of an unsatisfied endeavor; the source, consequently, not of inertia, but of perpetual fruitfulness. The pedantry was superficial. Beneath this jargon of the 'Orders'—to us so dead, to them so

full of inspiration—the Italian architects were solving a vast and necessary problem. They were leading back European style into the main road of European civilization—the Roman road which stretched forward and backward to the horizon, sometimes overlaid, but not for long to be avoided.

"They were adapting, enlarging, revivifying the forms of the antique to serve the uses of the modern world. The change was deeply natural. Europe no longer recognized itself in the hopes and habits of its immediate past; it did recognize itself, on the contrary, in that remoter and more civilized society in which it had its origin. The medieval styles had run their course and outlived their usefulness. To have resisted the logic of events, to have clung to the vestiges of local Gothic—vital and 'rational' as in their times they had been, picturesque and romantic as they are in their survival—this in truth would have led, in a few generations, to a state of architecture as unalive, as falsely academic, as were the shames of archeology three hundred years later. For an academic tradition, allied as it was in the Renaissance to a living sense of art, is fruitful; the academic theory is at all times barren."

"And this final rule or law of appreciation by Scott will do very well with which to square the reason for the Lincoln memorials that are Roman or Greek temples, or art galleries that are Italian palaces or Roman basilicas, or, as in the case of the one that is to crown the hill at Fairmount, the living adaptation of various types of classical and Renaissance architecture assembled and welded into a harmonious whole."

* * *

What will the advocates of "The American in Architecture"—men such as Irving H. Pond, Bertram Goodhue, Cass Gilbert, and a host of others—say to this?

BUILDING IN PHILADELPHIA.

The new year is opening up with bright prospects for operative builders, and notwithstanding the increased cost of all materials entering into construction work, as well as the greater cost of labor in the building trades, the opinion prevails that 1916 is likely to establish a new record in building operations in Philadelphia. It is expected that the greater portion of dwelling house construction will be done along the Northeast Boulevard, where sites for 3,000 to 4,000 homes have recently been sold. Much house building will also be done in West Philadelphia, where the outlook is most encouraging.—"National Builder."

OFFICE TENANTS NOW DEMAND GOOD AIR

Modern Business Has Reduced Efficiency Due to Ventilation to Matter of Dollars.

Ventilation has a wide significance when applied to the affairs of the human race and represents a desire for fresh air, supplied without discomfort. Efficiency has a comparatively new use in the modern science of obtaining the maximum returns for an expenditure of time and money. If a human being was at all times breathing fresh air at a comfortable temperature at an efficiency of 100 per cent. there would be no use for these words and they would probably not have been coined.

In the name of one or the other, many mechanical and commercial mistakes have been made and a proposed scheme for producing better ventilation or increasing efficiency is not blindly accepted, but starts with a handicap of doubt or unbelief because of the many failures that have been made by those who have been supposed to be expert.

The relation between ventilation and efficiency is close when the aim is to obtain the largest amount of work from a human being in return for his wages or salary. If it is provable that proper ventilation can be provided for offices, factories, homes, etc., the matter is of much interest to those who are studying problems in human efficiency. Man, in order to remain warm in winter weather, has housed himself in and provided means for heating the enclosures in which he lives. He has arranged for the admission of daylight when available and the production of artificial light when daylight fails. His desire for warmth has made him afraid of the admission of fresh unheated air during the colder months, and so mechanical apparatus has been designed with the object of delivering fresh air heated by passing it over steam pipes to the rooms occupied by students, patients, workers or those seeking amusement. Such apparatus is expensive in first cost and also for operating and upkeep. The use of mechanical apparatus has therefore been confined to schools, hospitals, theatres, auditoriums, factories and in some cases congested offices where the management believes that such an investment will be profitable.

The expenditure for this purpose has amounted to many millions of dollars and it is said that a very great percentage of installations of this nature are not operated because of unsatisfactory results and excessive operating charges. Many attempts have been made to obtain proper ventilation by admitting air through the windows, and devices of varying design have been placed on the market which admit a certain amount of air to

Riches can secure no better illuminant than Electric Light for the mansion, yet our rates are so low that every home—even the most modest—can afford it. Electric Light is the brightest, cleanest, most convenient and hygienic light, as well as the most economical.

If your house is not wired for Electricity, ask us for the details of our deferred payment housewiring plan.

the rooms, but owing to their faulty design and limited capacity they have failed to accomplish the results desired.

It has finally come to be accepted that breathing vitiated air is one of the ills that cannot be avoided and that if the human being is reasonably efficient without an hourly supply of fresh air, it is as much as can be expected under modern conditions. This belief is so prevalent that tenants seeking new quarters have heretofore considered advantages offered by the renting agents from every standpoint except that of ventilation. If the agent, in addition to the many valuable inducements that he offers, can add that each room will be supplied with the proper amount of fresh air without drafts or discomfort to the occupants, it will prove to be a valuable factor in his negotiations and perhaps the deciding argument that obtains a tenant for his building.

Owners and builders have long recognized that such an inducement would be of great value in rapidly renting their new buildings or in keeping their tenants from changing their quarters, but the excessive cost of placing mechanical apparatus in the cellars and basements and the cost not only of the ducts, but of the rentable floor space occupied by them, has made the matter of ventilation prohibitive in cost.

It is possible for a comparatively small amount of money to so install simple devices in each room that the proper amount of air can be delivered without causing discomfort to the occupants and without there being any upkeep or operating charges connected with it. A statement of this kind could not have been made two or three years ago, but much evidence is at hand to prove that these re-

sults are being obtained in a great number of offices in New York City with uniform satisfaction to the tenants of such offices.

Many surveys of offices in New York City have shown that where there are many office employees it is fair to assume that wages amounting to \$2,500 a year are paid to those receiving light from one window. It is a common practice in some of these offices to air the room by opening the windows at least four times a day and the figures furnished by the manager of one of these rooms show that the cost in wages for this method of ventilation is \$4 a day. This amounts to \$100 a month or \$600 for the six months of cool weather. The room in question can be properly ventilated for \$100; thus the saving in one month is sufficient to pay for the entire equipment.

Managers of large office forces have compiled statistics showing the loss to their companies occasioned by a cold of an employee, and they also have formed a fair idea as to the increased amount of work that can be obtained if the sleepy feeling late in the morning and late in the afternoon can be eliminated by the proper supply of fresh air to the rooms.

Much information is being furnished the public by those in charge of public schools, and especially the experts who are studying the physical and mental development of children. It has been found that the so-called

more difficult studies are taken up the first thing in the morning because the children do not seem to be mentally in condition to grasp them during the afternoon hours. Results, however, with the fresh air classes in which the children do their studying in rooms which are not heated, but are continually receiving air through the windows, demonstrate that the hardest subjects may be taught in the afternoon and that the students are as mentally active in the late hours of the day as they are in the early morning. These facts confirm the observations made by the managers of large office forces and point to a definite gain in amount and accuracy of the work if fresh air is continually supplied at proper temperature to the working force which is employed for many consecutive hours each day.

With the large amount of literature that is being published dealing with the advantage of a supply of fresh air, the movement to stamp out tuberculosis and recent newspaper articles by eminent scientists brought out by the prevalence of grip, the public is being educated on this subject. It seems possible that the time will come shortly when tenants will demand that their offices and workrooms must be properly ventilated, and owners and managers of buildings will be forced to face this situation if they wish to have their buildings rapidly and completely rented.—New York "Sun."

TWENTY-SECOND ARCHITECTURAL EXHIBITION

Annual Function of Philadelphia Chapter, A. I. A., and T-Square Club to Be Held in Art Club Galleries May 7th to May 28th—Some of the More Notable Local Designs That Will Be Shown—Out-of-Town Exhibitors—The Field of Applied Art, Accessories, Etc.

The twenty-second architectural exhibition of the Philadelphia Chapter, A. I. A., and T-Square Club will be held in the Art Club from May 7 to May 28. While it is not the intention of the committee in charge to make the exhibition a large one, the members promise it will be comprehensive and the exhibits of a high degree of excellence.

The exhibition will include original drawings, models and enlarged photographs of executed or proposed work illustrative of structural, decorative and landscape architecture. There will also be included sketches and paintings of decorative subjects and executed work in the applied arts. It is the hope to gather together in this exhibition the best architectural work of the year.

From out of town might be mentioned as of interest Cass Gilbert's Scott Fountain in Detroit, a monumental work of great importance. Also his Detroit Public Library. A

well designed country house near New York by Bertram G. Goodhue; also an interesting house by the same architect at Pasadena, Cal. There also will be large photographs fully illustrating the summer home of H. H. Rogers, at Southampton, L. I., Walker & Gillette, architects, of New York.

From Philadelphia of great local interest will be the model of the proposed development of the east bank of the Schuylkill River, between the Sedgeley Club and the Girard avenue bridge, under the direction of Edgar V. Seeler, architect, and Charles Grafy, sculptor.

Of further note will be the college work of Day & Klauder, examples of the work they have been commissioned to do for Wellesley College, Mass., and Cornell University; also a very interesting Christian Science church in Germantown, by the same architects; the winning design for the Carson College for Girls,

by Albert Kelsey; the accepted design for the Camden High School, by Paul A. Davis, 3d; Penn Mutual Building, by Edgar V. Seeler, and numerous examples of domestic work for the excellence of which Philadelphia is justly celebrated.

In the realm of applied arts will be included many well-executed examples of iron-

work, by the well-known craftsman, Samuel Yellin, and fine examples of decorative tile by the Enfield Pottery and Tile Works; also cartoons for stained glass by the D'Ascenzo Studio and others. Of special interest will be found the examples of silk batik hangings designed by C. Bertram Hartman, of New York.

Trade News and Gossip

Cullings from the Week's News with a Special Interest for Men Engaged in the Structural Industries—What is Happening in Trade and Architectural Circles.

**The annual meeting of the National Fire Protection Association will be held in the auditorium on the 21st floor of the Insurance Exchange at Jackson and La Salle streets, Chicago, on May 9th, 10th and 11th this year. The program will be mailed to members in advance of the meeting. A large attendance is hoped for.

**V. R. Lamontagne has opened an office in the Merger Building, Quebec, Canada, for the practice of architecture and constructing engineering. Samples and catalogues of building materials and accessories are desired by A. G. Nosworthy, architectural engineer, care V. R. Lamontagne, Merger Building, Quebec, Canada.

**The Federal Radiator Co., New Castle, Pa., has been organized to take over the business of the Novelty Iron Co., Canton, Ohio, and the entire plant of the Novelty Iron Company has been moved to New Castle. In connection with this change the company states that it now has one of the most modern and best equipped factories in the country for producing steam and hot water heating apparatus.

**H. F. Wardwell, former home office manager, was appointed general sales manager of the Fenestra Division of the Detroit Steel Products Company, Detroit, Mich., the change taking effect February 1. He succeeded P. A. Smith, who recently resigned to engage in another line of business.

**Clarence L. Harding, architect, has moved his offices from the Woodward Building to 729 Fifteenth street, Washington, D. C.

**The National Electrical Contractors' Association of the United States will hold its annual convention at the Hotel McAlpin, New

York, July 18-22. Secretary, G. W. Duffield, 41 Martin Building, Utica, N. Y.

**C. C. Tallman, architect, 17 Dill street, Auburn, N. Y., has recently taken into partnership Benjamin F. Bells, who was formerly connected with Claude Bragdon, of Rochester. The new firm will conduct a general architectural practice under the name of Tallman & Betts.

**Harry Louis Meacham has recently opened an office for the practice of architecture at 39 Circuit avenue, Worcester, Mass., and is desirous of obtaining catalogs and samples from manufacturers of building materials.

**The National Association of Master Plumbers will hold its annual convention at Atlantic City, N. J., June 22. The headquarters will be at the Hotel Breakers. The program for this convention will be announced later.

**The Richmond Radiator Co., New York, has opened a new warehouse in Philadelphia, at American and Dauphin streets. The warehouse is a two-story building covering a site 80x80 feet, which the company has stocked with Richmond boilers and radiators.

**Merchant & Evans Co., Philadelphia, Pa., manufacturers and dealers in metals and other products, including the Star ventilators, celebrated the fiftieth anniversary of its founding by removing its general offices and warehouse to a new location on Washington avenue, Philadelphia, between Twentieth and Twenty-first streets. Here the company has erected a modern office and warehouse adjoining its former works. It also has plants in Philadelphia, Wheeling and Chicago. The company was founded in 1866 by Clark Merchant, a retired lieutenant-commander in the

United States Navy, under the name of Merchant & Co., dealing principally in brass, bronze and copper in all their forms as then manufactured, and trading also in tin plates and other metals that were imported from England or other foreign countries. Recently the company has gone into the manufacture of gasoline motor trucks and tractor trucks.

CEMENT AND CONCRETE NOTES

**An estimate of Portland cement produced in the United States in 1915, just made by Ernest F. Burchard, of the United States Geological Survey, indicate that the shipments from the mills amounted to 86,524,500 barrels, compared with 86,437,956 barrels in 1914; the production was about 85,732,000 barrels, compared with 88,230,170 barrels in 1914, and the stocks of finished cement at the mills were about 11,583,000 barrels, compared with 12,893,863 barrels in 1914. The slight decrease in production and the considerable decrease in stock indicate greater caution in the industry, which in the preceding few years showed a tendency toward overproduction.

**The Lehigh district, which produces nearly 30 per cent. of the domestic cement, shipped 24,500,000 barrels, produced 24,860,000 barrels and stocked 3,460,000 barrels in 1915, showing increases respectively of 2.2 per cent. 1 per cent. and 10.9 per cent. over the corresponding totals for 1914.

**New York State shipped 5,236,500 barrels, produced 5,097,000 barrels and held in stock 825,000 barrels. These figures represent decreases respectively of 4.3 per cent., 13.4 per cent. and 15.1 per cent. compared with 1914.

**Ohio and Western Pennsylvania shipped 7,400,000 barrels, produced 7,200,000 barrels and had 750,000 barrels in stocks.

**Michigan and Northeastern Indiana shipped 5,545,000 barrels, produced 5,550,000 barrels and held stocks of 650,000 barrels.

**Southern Indiana and Kentucky shipped 2,780,000 barrels, produced 2,840,000 barrels and had 490,000 barrels in stock.

**The Illinois and Northwest Indiana district shipped 10,825,000 barrels, produced 10,200,000 barrels and had stocks of 1,511,000 barrels.

**The Pacific Coast district showed shipments of 5,867,000 barrels, production of 5,712,000 barrels and had stocks of 880,000 barrels.

**Cement plants in Kansas, Nebraska, Oklahoma and central Texas showed total shipments of 6,546,000 barrels, production of 6,378,000 barrels and stocks of 786,000 barrels.

**In Colorado, Utah, Montana and Western Texas the shipments approximated 2,475,000 barrels, the production 2,525,000 barrels and the stocks 300,000 barrels.

**The general prices averaged a few cents lower per barrel in 1915 than in 1914, although toward the end of the year they were considerably higher. The statistics show that the general volume of business was about the same as in 1915, though it was not uniformly

distributed throughout the year. During the early part of the year the demand for cement was not great, and in some districts the industry was depressed during the summer by excessive rainfall, but in the last four months or more a decided change for the better has occurred both in demand and prices, so that the outlook for 1916 is brighter than for several seasons.

**Harold M. Scott, formerly connected with the Lehigh Portland Cement Company, has become salesmanager of the Edison Portland Cement Co., 1133 Broadway.

**In discussing the question, "Why is a barrel the unit of cement measure?" a writer in a late issue of "Concrete" comments as follows:

"The Standard Specifications for Portland cement, under General Conditions provide that:

"A bag of cement shall contain 94 lbs. of cement net, and each barrel of Portland cement four bags.

"The 400-lb. barrel originated at the time when all our Portland cement came from abroad and was actually packed in barrels. When we began to make Portland cement in this country we put it up in barrels weighing 400 lbs. gross. Later, when, as a matter of package conservation, we began to put it up in sacks, we ascertained the net weight per barrel and divided it by four.

"As will be seen from the specifications, the official unit of quantity is the bag or sack, which must contain 94 lbs. of cement. This being the standard unit of quantity as well as the unit in which nearly all cement is actually handled, why not make our prices, contracts, invoices, bills of lading, etc., read sacks or bags instead of barrels? In other words, why not price cement in cloth 35 cents per sack gross instead of \$1.40 per bbl. gross, and in paper 27½ cents per bag gross, instead of \$1.10 per bbl. gross?

"In tracing a quantity of cement from the time a quotation is made until the empty sack has been returned it will be seen that the figures are frequently converted from barrels to sacks, and sacks to barrels.

"A price is made and accepted. The order calls for barrels, but when it is sent to the mill, barrels are converted into sacks and sacks are loaded into the car. In making out the invoice, however, the sacks are converted into barrels, but when the consignee receives the car he converts the barrels on the invoice to sacks to check out the contents of the car. When the dealer's customer buys 10 bbls. of cement his order is converted to sacks and 40 sacks are delivered, but in invoicing the material the sacks are converted into barrels and the invoice calls for 10 bbls. The customer then changes this to sacks to make it correspond with the actual delivery.

"When the sacks are emptied the word 'barrel' seems to get out of our vocabulary and instead of calling 'four empty sacks' 'one empty barrel,' the sacks are called by their right name.

"Why should not prices, orders, contracts, invoices, bills of lading, etc., correspond with

our goods? This change may seem quite formidable and it would involve a change in the habit of thought of some people, principally the manufacturers of cement, but against the inconvenience of a few hundred people, we will have the convenience of hundreds of thousands of engineers, architects, inspectors, dealers, contractors, bookkeepers, farmers, teamsters, etc.

**The National Association of Mixed Manufacturers is made up of ten of the leading manufacturers of concrete mixers, and it was the rapid growth of the industry and the lack of standards that were responsible for the formation of the organization. President Capron has stated that the object of the association is to standardize the ratings of concrete mixers, to improve conditions in the field and to establish harmonious co-operation among manufacturers in the marketing of their products.

One of the first progressive moves undertaken by the members was the standardization of concrete mixer ratings, and after thorough investigation and discussion it was decided to adopt the wet batch.

This action has been indorsed by the American Concrete Institute, the American Society of Engineering Contractors, the Lehigh Portland Cement Co., the Universal Portland Cement Co., the Chicago Portland Cement Co., the Chicago Portland Cement Co., and A. N. Talbert, of the University of Illinois.

The officers are: President, H. M. Capron, president of the Marsh-Capron Manufacturing Co., Chicago, Ill.; treasurer, F. C. Wilcox, Foote Concrete Machinery Co., Chicago, Ill.; secretary, Harold E. Smith, the T. L. Smith Co., Milwaukee, Wis.

The association holds meetings every month, and one took place during the Cement Show, which was held in Chicago, February 12-19.

The efforts of this organization have received the hearty support of concerns and individuals interested in the welfare of the industry, and the move is evidently a step in the right direction.

NATION-WIDE BUILDING SLUMP.

High Material Prices Reflected in Fewer Buildings at Increased Cost.

Building activity throughout the country last month was less in volume than that of a year ago, but the cost was considerably greater. Reports to "Bradstreet's" journal from 107 cities show 18,721 permits filed during March, with an estimated value of building planned or permitted for of \$68,181,668, a decrease of 12.5 per cent. in permits, but a gain of 14.1 per cent. in value as compared with March a year ago. The returns are very irregular, as shown by the fact that every group of cities shows a decrease in permits, while all but two groups show gains in estimated expenditure. In the detailed list by cities, too, it is found that fifty-six cities show gains, while fifty-one show decreases from March a year ago.

For the first quarter of 1916 expenditures

aggregate \$177,600,265, a gain of 18.2 per cent. over the first quarter of 1915, which showed a loss of 11.2 per cent. from 1914.

Reports from individual cities show gains of 26.6 per cent. at New York (three boroughs reporting); Pittsburgh gains 75.6 per cent., Detroit 29.5 per cent., Toledo 34 per cent., Chicago 55 per cent., Milwaukee 5.5 per cent., St. Paul 29.4 per cent., Washington 121 per cent., and Los Angeles 26 per cent. Important cities showing decreases are Philadelphia 14.8 per cent., Cincinnati 32.6 per cent., Cleveland 54.3 per cent., and Minneapolis 28.9 per cent.

START WORK SOON ON NAVE OF EPISCOPAL CATHEDRAL.

Expected to Be Finished in Five Years and Cost \$3,000,000.

Work on the nave of the Episcopal Cathedral of St. John the Divine, in New York, says the "Engineering Record," which will be the largest church in the United States, will begin on May 8. The work is expected to take five years and to cost nearly \$3,000,000. The transepts, choir and crossing were completed some years ago.

The cost of the first stage of the new work is estimated to be about \$78,000, and it is hoped that contributions will have been plentiful enough by the time the first work is completed to authorize the continuance of the construction. The nave, when completed, will be 260 feet long, 135 feet wide and 160 feet high, with a single large chamber, the interior height of which will be 125 feet.

The cathedral was designed by Cram & Ferguson, architects, of New York, and the contract has been let to Jacobs & Young, also of New York.

\$89,000,000 IN NEW APARTMENTS.

Flat builders in the metropolitan district of which Manhattan is the centre filed plans this year for 2,570 new houses containing 43,580 apartments designed to accommodate 150,000 persons and costing \$89,000,000. This sum almost exactly equals the assessed valuation of all the taxable property of Lowell, Mass.—"New York World."

FIX UP YOUR BUILDINGS.

The spring renting season is now here, and owners of vacant buildings all want tenants. They should put their buildings in good condition, and tenants would be had much quicker. Every building owner seems afraid to spend anything on betterments until he is assured of a tenant. That is a safe plan, but it is not a sure one. Better buildings attract more tenants at better rates, and certainly improve the city's appearance.—New York "Record and Guide."

Philadelphia is one of the busiest building centers in the United States and "The Guide" is the only medium that touches this golden field.

The Standard Documents of the American Institute of Architects

The New Contract Documents of the American Institute of Architects are now on sale and replace the old Uniform Contract, which is to be discontinued

PRICES FOR SINGLE COPIES

Agreement and General Conditions in cover	\$.10
Bond of Suretyship	.02
Form of Subcontract	.02
Letter of Acceptance of Subcontractor's Proposal	.01
Complete set in cover	.15

Trial set delivered upon receipt of nine 2-cent stamps.

These Documents have received the full approval of the Institute, through its Convention, Board of Directors and Officers. They are the outcome of nine years of continuous work by a Standing Committee on Contracts and Specifications. This Committee, comprising some of the ablest American architects, was assisted by the Institute's forty Chapters; advised by eminent legal specialists in contract law and aided by representatives of the Building Trade Associations of the United States. The forms have been officially approved by the National Association of Builders' Exchanges, the National Association of Master Plumbers, and the National Association of Steam and Hot Water Fitters.
